MSP430FR597x(1),MSP430FR592x(1) MSP430FR587x(1) Mixed-Signal Microcontrollers

1 Device Overview

1.1 Features

- Embedded Microcontroller
  - 16-Bit RISC Architecture up to 16-MHz Clock
  - Wide Supply Voltage Range From 3.6 V Down to 1.8 V (Minimum Supply Voltage is Restricted by SVS Levels, See the SVS Specifications)
- Optimized Ultra-Low-Power Modes
  - Active Mode: Approximately 100 µA/MHz
  - Standby (LPM3 With VLO): 0.4 µA (Typical)
  - Real-Time Clock (RTC) (LPM3.5): 0.35 µA (Typical) [1]
  - Shutdown (LPM4.5): 0.04 µA (Typical)
- Ultra-Low-Power Ferroelectric RAM (FRAM)
  - Up to 64KB of Nonvolatile Memory
  - Ultra-Low-Power Writes
  - Fast Write at 125 ns per Word (64KB in 4 ms)
  - Unified Memory = Program, Data, and Storage in One Single Space
  - 10^{15} Write Cycle Endurance
  - Radiation Resistant and Nonmagnetic
- Intelligent Digital Peripherals
  - 32-Bit Hardware Multiplier (MPY)
  - Three-Channel Internal Direct Memory Access (DMA)
  - RTC With Calendar and Alarm Functions
  - Five 16-Bit Timers With up to Seven Capture/Compare Registers
  - 16-Bit and 32-Bit Cyclic Redundancy Checker (CRC16, CRC32)
- High-Performance Analog
  - Up to 8-Channel Analog Comparator
  - 12-Bit Analog-to-Digital Converter (ADC) With Internal Reference and Sample-and-Hold and up to 8 External Input Channels
- Code Security and Encryption
  - 128-Bit or 256-Bit AES Security Encryption and Decryption Coprocessor (MSP430FR59xx(1) Only)

[1] The RTC is clocked by a 3.7-pF crystal.

- True Random Number Seed for Random Number Generation Algorithm
- Lockable Memory Segments for IP Encapsulation and Secure Storage
- Multifunction Input/Output Ports
  - All I/O Pins Support Capacitive Touch Capability Without Need for External Components
  - Accessible Bit-, Byte- and Word-Wise (in Pairs)
  - Edge-Selectable Wakeup From LPM on Ports P1 to P4
  - Programmable Pullup and Pulldown on All Ports
- Enhanced Serial Communication
  - eUSCI_A0 and eUSCI_A1 Support:
    - UART With Automatic Baud-Rate Detection
    - IrDA Encode and Decode
    - SPI at Rates up to 10 Mbps
  - eUSCI_B0 and eUSCI_B1 Support:
    - I^2C With Multiple-Slave Addressing
    - SPI at Rates up to 10 Mbps
- Flexible Clock System
  - Fixed-Frequency DCO With 10 Selectable Factory-Trimmed Frequencies
  - Low-Power Low-Frequency Internal Clock Source (VLO)
  - 32-kHz Crystals (LFXT)
  - High-Frequency Crystals (HFXT)
- Development Tools and Software
  - Free Professional Development Environments With EnergyTrace++™ Technology for Power Profiling and Debugging
  - Microcontroller Development Boards Available
- Family Members
  - Device Comparison Summarizes the Available Variants and Packages
- For Complete Module Descriptions, See the *MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide*

1.2 Applications

- Metering
- Energy Harvested Sensor Nodes
- Wearable Electronics

- Sensor Management
- Data Logging

1.3 Description

This ultra-low-power MSP430FRxx FRAM microcontroller family consists of several devices featuring embedded nonvolatile FRAM, a 16-bit CPU, and different sets of peripherals targeted for various applications. The architecture, FRAM, and peripherals, combined with seven low-power modes, are optimized to achieve extended battery life in portable and wireless sensing applications. FRAM is a new nonvolatile memory that combines the speed, flexibility, and endurance of SRAM with the stability and reliability of flash, all at lower total power consumption.
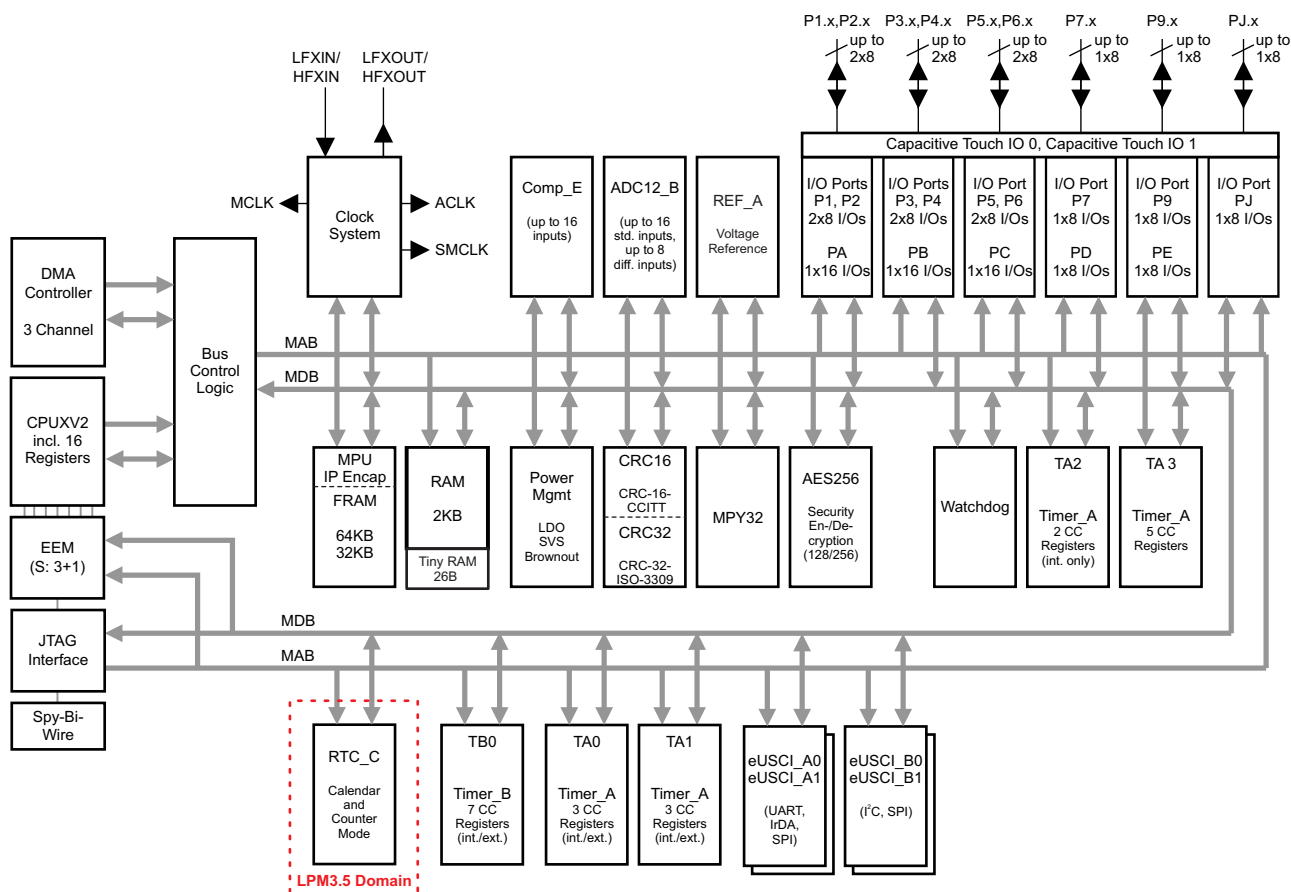

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE[2]
MSP430FR5972IPMR	LQFP (64)	10 mm × 10 mm
MSP430FR5972IRGC	VQFN (64)	9 mm × 9 mm
MSP430FR5922IG56	TSSOP (56)	6.1 mm × 14 mm

(1) For the most current part, package, and ordering information for all available devices, see the *Package Option Addendum* in Section 9, or see the TI website at www.ti.com.
(2) The sizes shown here are approximations. For the package dimensions with tolerances, see the *Mechanical Data* in Section 9.

3 Device Comparison

Table 3-1 and Table 3-2 summarize the available family members.

Table 3-1. Device Comparison – Family Members With UART BSL

DEVICE	FRAM (KB)	SRAM (KB)	CLOCK SYSTEM	Timer_A[1]	Timer_B[2]	eUSCI A[3]	eUSCI B[4]	AES	ADC12_B	I/O	PACKAGE
MSP430FR5972	64	2	DCO **HFXT** **LFXT**	3, 3[5] 2, 5[6][7]	7	2	2	yes	8 ext	51	64 PM 64 RGC
MSP430FR5872	64	2	DCO **HFXT** **LFXT**	3, 3[5] 2, 5[6][7]	7	2	2	no	8 ext	51	64 PM 64 RGC
MSP430FR5970	32	2	DCO **HFXT** **LFXT**	3, 3[5] 2, 5[6][7]	7	2	2	yes	8 ext	51	64 PM 64 RGC
MSP430FR5922	64	2	DCO **LFXT**	3, 3[5] 2, 5[6][7]	7	2	2	yes	8 ext	51 46 (DGG)	64 PM 64 RGC 56 DGG
MSP430FR5870	32	2	DCO **HFXT** **LFXT**	3, 3[5] 2, 5[6][7]	7	2	2	no	8 ext	51	64 PM 64 RGC

(1) Each number in the sequence represents an instantiation of Timer_A with its associated number of capture compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer_A, the first instantiation having 3 and the second instantiation having 5 capture compare registers and PWM output generators, respectively.
(2) Each number in the sequence represents an instantiation of Timer_B with its associated number of capture compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer_B, the first instantiation having 3 and the second instantiation having 5 capture compare registers and PWM output generators, respectively.
(3) eUSCI_A supports UART with automatic baud-rate detection, IrDA encode and decode, and SPI.
(4) eUSCI_B supports I^{2}C with multiple slave addresses and SPI.
(5) Timer_A TA0 and TA1 provide internal and external capture/compare inputs and internal and external PWM outputs.
(6) Timer_A TA2 provides only internal capture/compare inputs and only internal PWM outputs (if any).
(7) Timer_A TA3 provides only internal capture/compare inputs and only internal PWM outputs (if any) for FR592x(1) with RGC and PM packages. For FR592x(1) with DGG package and all other devices, Timer_A TA3 provides internal, external capture/compare inputs and internal, external PWM outputs (if any).

SLASE66C −APRIL 2015−REVISED AUGUST 2018

4.4 Pin Multiplexing

Pin multiplexing for these devices is controlled by both register settings and operating modes (for example, if the device is in test mode). For details of the settings for each pin and schematics of the multiplexed ports, see Section 6.11.22.

4.5 Buffer Type

Table 4-3 describes the buffer types that are referenced in Section 4.2.

Table 4-3. Buffer Type

BUFFER TYPE (STANDARD)	NOMINAL VOLTAGE	HYSTERESIS	PU OR PD	NOMINAL PU OR PD STRENGTH (µA)	OUTPUT DRIVE STRENGTH (mA)	OTHER CHARACTERISTICS
LVCMOS	3.0 V	Y[1]	Programmable	See Table 5-11	See Section 5.12.5.1	
Analog	3.0 V	N	N/A	N/A	N/A	See analog modules in Section 5 for details
Power (DVCC)	3.0 V	N	N/A	N/A	N/A	SVS enables hysteresis on DVCC
Power (AVCC)	3.0 V	N	N/A	N/A	N/A	

(1) Only for Input pins.

4.6 Connection of Unused Pins

Table 4-4 lists the correct termination of all unused pins.

Table 4-4. Connection of Unused Pins[1]

PIN	POTENTIAL	COMMENT
AVCC	DV_{CC}	
AVSS	DV_{SS}	
Px.0 to Px.7	Open	Switched to port function, output direction (PxDIR.n = 1)
$\overline{RST}$/NMI	DV_{CC} or V_{CC}	47-kΩ pullup or internal pullup selected with 10-nF (2.2 nF[2]) pulldown
PJ.0/TDO PJ.1/TDI PJ.2/TMS PJ.3/TCK	Open	The JTAG pins are shared with general-purpose I/O function (PJ.x). If these pins are not used, they should be set to port function and output direction. When used as JTAG pins, these pins should remain open.
TEST	Open	This pin always has an internal pulldown enabled.

(1) Any unused pin with a secondary function that is shared with general-purpose I/O should follow the Px.0 to Px.7 unused pin connection guidelines.
(2) The pulldown capacitor should not exceed 2.2 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools like FET interfaces or GANG programmers.

TEXAS INSTRUMENTS

SLASE66C –APRIL 2015–REVISED AUGUST 2018 **www.ti.com**

5 Specifications

5.1 Absolute Maximum Ratings[1]

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Voltage applied at DVCC and AVCC pins to V_{SS}	−0.3	4.1	V
Voltage difference between DVCC and AVCC pins[2]		±0.3	V
Voltage applied to any pin [3]	−0.3	V_{CC} + 0.3 (4.1 Maximum)	V
Diode current at any device pin		±2	mA
Storage temperature, T_{stg}[4]	−40	125	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Voltage differences between DVCC and AVCC exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and FRAM.
(3) All voltages referenced to V_{SS}.
(4) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

5.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±250	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

5.3 Recommended Operating Conditions

Typical data are based on V_{CC} = 3.0 V, T_A = 25°C (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage applied at all DVCC and AVCC pins[1] [2] [3]		1.8[4]		3.6	V
V_{SS}	Supply voltage applied at all DVSS and AVSS pins			0		V
T_A	Operating free-air temperature		−40		85	°C
T_J	Operating junction temperature		−40		85	°C
C_{DVCC}	Capacitor value at DVCC[5]		1−20%			µF
f_{SYSTEM}	Processor frequency (maximum MCLK frequency)[6]	No FRAM wait states (NWAITSx = 0)	0		8[7]	MHz
		With FRAM wait states (NWAITSx = 1)[8]	0		16[9]	
f_{ACLK}	Maximum ACLK frequency				50	kHz
f_{SMCLK}	Maximum SMCLK frequency				16[9]	MHz

(1) TI recommends powering AVCC and DVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference between AVCC and DVCC must not exceed the limits specified in *Absolute Maximum Ratings*. Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and FRAM.
(2) Fast supply voltage changes can trigger a BOR reset even within the recommended supply voltage range. To avoid unwanted BOR resets, the supply voltage must change by less than 0.05 V per microsecond (±0.05 V/µs). Following the data sheet recommendation for capacitor C_{DVCC} should limit the slopes accordingly.
(3) Modules may have a different supply voltage range specification. See the specification of the respective module in this data sheet.
(4) The minimum supply voltage is defined by the supervisor SVS levels. See the PMM SVS threshold parameters in Table 5-2 for the exact values.
(5) As decoupling capacitor for each supply pin pair (DVCC and DVSS, AVCC and AVSS), a low-ESR ceramic capacitor of 100 nF (minimum) should be placed as close as possible (within a few millimeters) to the respective pin pairs.
(6) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.
(7) DCO settings and HF crystals with a typical value less than or equal to the specified MAX value are permitted.
(8) Wait states only occur on actual FRAM accesses; that is, on FRAM cache misses. RAM and peripheral accesses are always executed without wait states.
(9) DCO settings and HF crystals with a typical value less than or equal to the specified MAX value are permitted. If a clock source with a higher typical value is used, the clock must be divided in the clock system.

I$_{AM, FRAM}$(50%)[4] [5]	FRAM 50% cache hit ratio	3.0 V	240		745		1440		1575		1990		µA
I$_{AM, FRAM}$(66%)[4] [5]	FRAM 66% cache hit ratio	3.0 V	200		560		1070		1300		1620		µA
I$_{AM, FRAM}$(75%)[4] [5]	FRAM 75% cache hit ratio	3.0 V	170	255	480		890	1085	1155	1310	1420	1620	µA
I$_{AM, FRAM}$(100%)[4] [5]	FRAM 100% cache hit ratio	3.0 V	110		235		420		640		730		µA
I$_{AM, RAM}$ [6] [5]	RAM	3.0 V	130		320		585		890		1070		µA
I$_{AM, RAM\ only}$ [7] [5]	RAM	3.0 V	100	180	290		555		860		1040	1300	µA

(1) All inputs are tied to 0 V or to V$_{CC}$. Outputs do not source or sink any current.
(2) Characterized with program executing typical data processing.
   f$_{ACLK}$ = 32768 Hz, f$_{MCLK}$ = f$_{SMCLK}$ = f$_{DCO}$ at specified frequency, except for 12 MHz. For 12 MHz, f$_{DCO}$= 24 MHz and
   f$_{MCLK}$ = f$_{SMCLK}$ = f$_{DCO}$/2.
   At MCLK frequencies above 8 MHz, the FRAM requires wait states. When wait states are required, the effective MCLK frequency
   (f$_{MCLK,eff}$) decreases. The effective MCLK frequency also depends on the cache hit ratio. SMCLK is not affected by the number of wait
   states or the cache hit ratio.
   The following equation can be used to compute f$_{MCLK,eff}$:
   f$_{MCLK,eff}$ = f$_{MCLK}$ / [wait states × (1 - cache hit ratio) + 1]
   For example, with 1 wait state and 75% cache hit ratio f$_{MCKL,eff}$ = f$_{MCLK}$ / [1 × (1 - 0.75) + 1] = f$_{MCLK}$ / 1.25.
(3) Represents typical program execution. Program and data reside entirely in FRAM. All execution is from FRAM.
(4) Program resides in FRAM. Data resides in SRAM. Average current dissipation varies with cache hit-to-miss ratio as specified. Cache hit
   ratio represents number cache accesess divided by the total number of FRAM accesses. For example, a 75% ratio implies three of
   every four accesses is from cache, and the remaining are FRAM accesses.
(5) See Figure 5-1 for typical curves. Each characteristic equation shown in the graph is computed using the least squares method for best
   linear fit using the typical data shown in Section 5.4.
(6) Program and data reside entirely in RAM. All execution is from RAM.
(7) Program and data reside entirely in RAM. All execution is from RAM. FRAM is off.

5.5 Typical Characteristics - Active Mode Supply Currents

NOTE: I(AM, cache hit ratio): Program resides in FRAM. Data resides in SRAM. Average current dissipation varies with cache hit-to-miss ratio as specified. Cache hit ratio represents number cache accesses divided by the total number of FRAM accesses. For example, a 75% ratio implies three of every four accesses is from cache, and the remaining are FRAM accesses.

NOTE: $I_{(AM, RAMonly)}$: Program and data reside entirely in RAM. All execution is from RAM. FRAM is off.

Figure 5-1. Typical Active Mode Supply Currents, No Wait States

5.6 Low-Power Mode (LPM0, LPM1) Supply Currents Into V_{CC} Excluding External Current

over recommended operating free-air temperature (unless otherwise noted)[1] [2]

PARAMETER	V_{CC}	FREQUENCY (f_{SMCLK})										UNIT
		1 MHz		4 MHz		8 MHz		12 MHz		16 MHz		
		TYP	MAX	TYP	MAX	TYP	MAX	TYP	MAX	TYP	MAX	
I_{LPM0}	2.2 V	75		105		165		250		230		µA
	3.0 V	80	120	115		175		260		240	275	
I_{LPM1}	2.2 V	40		65		130		215		195		µA
	3.0 V	40	65	65		130		215		195	220	

(1) All inputs are tied to 0 V or to V_{CC}. Outputs do not source or sink any current.
(2) Current for watchdog timer clocked by SMCLK included.
f_{ACLK} = 32768 Hz, f_{MCLK} = 0 MHz, f_{SMCLK} = f_{DCO} at specified frequency - except for 12 MHz: here f_{DCO}=24MHz and f_{SMCLK} = f_{DCO}/2.

		3.0 V	0.35		0.4	0.7	0.8		1.7	5.2	

(1) All inputs are tied to 0 V or to V$_{CC}$. Outputs do not source or sink any current.
(2) Not applicable for devices with HF crystal oscillator only.
(3) Characterized with a Micro Crystal MS1V-T1K crystal with a load capacitance of 12.5 pF. The internal and external load capacitance are chosen to closely match the required 12.5 pF load.
(4) Low-power mode 2, crystal oscillator test conditions:
Current for watchdog timer clocked by ACLK and RTC clocked by XT1 included. Current for brownout and SVS included.
CPUOFF = 1, SCG0 = 0 SCG1 = 0, OSCOFF = 0 (LPM2),
f$_{XT1}$ = 32768 Hz, f$_{ACLK}$ = f$_{XT1}$, f$_{MCLK}$ = f$_{SMCLK}$ = 0 MHz
(5) Characterized with a Seiko SSP-T7-FL (SMD) crystal with a load capacitance of 3.7 pF. The internal and external load capacitance are chosen to closely match the required 3.7-pF load.
(6) Low-power mode 2, VLO test conditions:
Current for watchdog timer clocked by ACLK included. RTC disabled (RTCHOLD = 1). Current for brownout and SVS included.
CPUOFF = 1, SCG0 = 0 SCG1 = 1, OSCOFF = 0 (LPM2),
f$_{XT1}$ = 0 Hz, f$_{ACLK}$ = f$_{VLO}$, f$_{MCLK}$ = f$_{SMCLK}$ = 0 MHz
(7) Low-power mode 3, 12-pF crystal, includes SVS test conditions:
Current for watchdog timer clocked by ACLK and RTC clocked by XT1 included. Current for brownout and SVS included (SVSHE = 1).
CPUOFF = 1, SCG0 = 1 SCG1 = 1, OSCOFF = 0 (LPM3),
f$_{XT1}$ = 32768 Hz, f$_{ACLK}$ = f$_{XT1}$, f$_{MCLK}$ = f$_{SMCLK}$ = 0 MHz
Activating additional peripherals increases the current consumption due to active supply current contribution as well as due to additional idle current. See the idle currents specified for the respective peripheral groups.
(8) Low-power mode 3, 3.7-pF crystal, excludes SVS test conditions:
Current for watchdog timer clocked by ACLK and RTC clocked by XT1 included. Current for brownout included. SVS disabled (SVSHE = 0).
CPUOFF = 1, SCG0 = 1 SCG1 = 1, OSCOFF = 0 (LPM3),
f$_{XT1}$ = 32768 Hz, f$_{ACLK}$ = f$_{XT1}$, f$_{MCLK}$ = f$_{SMCLK}$ = 0 MHz
Activating additional peripherals increases the current consumption due to active supply current contribution as well as due to additional idle current. See the idle currents specified for the respective peripheral groups.
(9) Low-power mode 3, VLO, excludes SVS test conditions:
Current for watchdog timer clocked by ACLK included. RTC disabled (RTCHOLD = 1). Current for brownout included. SVS disabled (SVSHE = 0).
CPUOFF = 1, SCG0 = 1 SCG1 = 1, OSCOFF = 0 (LPM3),
f$_{XT1}$ = 0 Hz, f$_{ACLK}$ = f$_{VLO}$, f$_{MCLK}$ = f$_{SMCLK}$ = 0 MHz
Activating additional peripherals increases the current consumption due to active supply current contribution as well as due to additional idle current. See the idle currents specified for the respective peripheral groups.
(10) Low-power mode 3, VLO, excludes SVS, RAM powered down completely test conditions:
Current for watchdog timer clocked by ACLK included. RTC disabled (RTCHOLD = 1). Current for brownout included. SVS disabled (SVSHE = 0). RAM disabled (RCCTL0 = 5A55h).
CPUOFF = 1, SCG0 = 1 SCG1 = 1, OSCOFF = 0 (LPM3),
f$_{XT1}$ = 0 Hz, f$_{ACLK}$ = f$_{VLO}$, f$_{MCLK}$ = f$_{SMCLK}$ = 0 MHz
Activating additional peripherals increases the current consumption due to active supply current contribution as well as due to additional idle current. See the idle currents specified for the respective peripheral groups.

CRC32	Only from start to end of operation	MCLK		2.5		µA/MHz

5.11 Thermal Resistance Characteristics[1]

	PARAMETER	PACKAGE	VALUE[1]	UNIT
θ_{JA}	Junction-to-ambient thermal resistance, still air[2]	TSSOP-56 (DGG)	57.7	°C/W
$\theta_{JC(TOP)}$	Junction-to-case (top) thermal resistance[3]		15.1	°C/W
θ_{JB}	Junction-to-board thermal resistance[4]		26.5	°C/W
Ψ_{JB}	Junction-to-board thermal characterization parameter		26.2	°C/W
Ψ_{JT}	Junction-to-top thermal characterization parameter		0.5	°C/W
$\theta_{JC(BOTTOM)}$	Junction-to-case (bottom) thermal resistance[5]		N/A	°C/W
θ_{JA}	Junction-to-ambient thermal resistance, still air[2]	QFP-64 (PN)	59.3	°C/W
$\theta_{JC(TOP)}$	Junction-to-case (top) thermal resistance[3]		19.5	°C/W
θ_{JB}	Junction-to-board thermal resistance[4]		30.8	°C/W
Ψ_{JB}	Junction-to-board thermal characterization parameter		30.5	°C/W
Ψ_{JT}	Junction-to-top thermal characterization parameter		1.0	°C/W
$\theta_{JC(BOTTOM)}$	Junction-to-case (bottom) thermal resistance[5]		N/A	°C/W
θ_{JA}	Junction-to-ambient thermal resistance, still air[2]	QFN-64 (RGC)	29.6	°C/W
$\theta_{JC(TOP)}$	Junction-to-case (top) thermal resistance[3]		15.8	°C/W
θ_{JB}	Junction-to-board thermal resistance[4]		8.5	°C/W
Ψ_{JB}	Junction-to-board thermal characterization parameter		8.5	°C/W
Ψ_{JT}	Junction-to-top thermal characterization parameter		0.2	°C/W
$\theta_{JC(BOTTOM)}$	Junction-to-case (bottom) thermal resistance[5]		1.2	°C/W

(1) N/A = not applicable
(2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, High-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
(3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
(5) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

5.12 Timing and Switching Characteristics

5.12.1 Power Supply Sequencing

TI recommends powering AVCC and DVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference between AVCC and DVCC must not exceed the limits specified in Absolute Maximum Ratings. Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and FRAM.

Table 5-1 lists the reset power ramp requirements.

Table 5-1. Brownout and Device Reset Power Ramp Requirements

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
V_{VCC_BOR-}	Brownout power-down level[1]	$\mid dDV_{CC}/d_t \mid <$ 3 V/s[2]	0.73	1.66	V
V_{VCC_BOR+}	Brownout power-up level[1]	$\mid dDV_{CC}/d_t \mid <$ 3 V/s[2]	0.79	1.68	V

(1) Fast supply voltage changes can trigger a BOR reset even within the recommended supply voltage range. To avoid unwanted BOR resets, the supply voltage must change by less than 0.05 V per microsecond (±0.05 V/µs). Following the data sheet recommendation for capacitor C_{DVCC} should limit the slopes accordingly.
(2) The brownout levels are measured with a slowly changing supply.

Table 5-2 lists the characteristics of the SVS.

Table 5-2. SVS

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$I_{SVSH,LPM}$	SVS_H current consumption, low power modes			170	300	nA
V_{SVSH-}	SVS_H power-down level[1]		1.75	1.80	1.85	V
V_{SVSH+}	SVS_H power-up level[1]		1.77	1.88	1.99	V
V_{SVSH_hys}	SVS_H hysteresis		40		120	mV
$t_{PD,SVSH, AM}$	SVS_H propagation delay, active mode	$dV_{Vcc}/dt = -10$ mV/µs			10	µs

(1) For additional information, see the Dynamic Voltage Scaling Power Solution for MSP430 Devices With Single-Channel LDO Reference Design.

5.12.2 Reset Timing

Table 5-11 lists the required reset input timing.

Table 5-3. Reset Input

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		V_{CC}	MIN	MAX	UNIT
$t_{(RST)}$	External reset pulse duration on $\overline{RST}$[1]	2.2 V, 3.0 V	2		µs

(1) Not applicable if the $\overline{RST}$/NMI pin is configured as NMI.

5.12.3 Clock Specifications

Table 5-4 lists the characteristics of the LFXT.

Table 5-4. Low-Frequency Crystal Oscillator, LFXT[1]

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
$I_{VCC.LFXT}$	Current consumption	f_{OSC} = 32768 Hz, LFXTBYPASS = 0, LFXTDRIVE = {0}, T_A = 25°C, $C_{L,eff}$ = 3.7 pF, ESR ≈ 44 kΩ	3.0 V		180		nA
		f_{OSC} = 32768 Hz, LFXTBYPASS = 0, LFXTDRIVE = {1}, T_A = 25°C, $C_{L,eff}$ = 6 pF, ESR ≈ 40 kΩ			185		
		f_{OSC} = 32768 Hz, LFXTBYPASS = 0, LFXTDRIVE = {2}, T_A = 25°C, $C_{L,eff}$ = 9 pF, ESR ≈ 40 kΩ			225		
		f_{OSC} = 32768 Hz, LFXTBYPASS = 0, LFXTDRIVE = {3}, T_A = 25°C, $C_{L,eff}$ = 12.5 pF, ESR ≈ 40 kΩ			330		
f_{LFXT}	LFXT oscillator crystal frequency	LFXTBYPASS = 0			32768		Hz
DC_{LFXT}	LFXT oscillator duty cycle	Measured at ACLK, f_{LFXT} = 32768 Hz		30%		70%	
$f_{LFXT,SW}$	LFXT oscillator logic-level square-wave input frequency	LFXTBYPASS = 1 [2] [3]		10.5	32.768	50	kHz
$DC_{LFXT, SW}$	LFXT oscillator logic-level square-wave input duty cycle	LFXTBYPASS = 1		30%		70%	
OA_{LFXT}	Oscillation allowance for LF crystals [4]	LFXTBYPASS = 0, LFXTDRIVE = {1}, f_{LFXT} = 32768 Hz, $C_{L,eff}$ = 6 pF			210		kΩ
		LFXTBYPASS = 0, LFXTDRIVE = {3}, f_{LFXT} = 32768 Hz, $C_{L,eff}$ = 12.5 pF			300		
C_{LFXIN}	Integrated load capacitance at LFXIN terminal [5] [6]				2		pF
C_{LFXOUT}	Integrated load capacitance at LFXOUT terminal [5] [6]				2		pF

(1) To improve EMI on the LFXT oscillator, the following guidelines should be observed.
- Keep the trace between the device and the crystal as short as possible.
- Design a good ground plane around the oscillator pins.
- Prevent crosstalk from other clock or data lines into oscillator pins LFXIN and LFXOUT.
- Avoid running PCB traces underneath or adjacent to the LFXIN and LFXOUT pins.
- Use assembly materials and processes that avoid any parasitic load on the oscillator LFXIN and LFXOUT pins.
- If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.

(2) When LFXTBYPASS is set, LFXT circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this data sheet. Duty cycle requirements are defined by $DC_{LFXT, SW}$.

(3) Maximum frequency of operation of the entire device cannot be exceeded.

(4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the LFXTDRIVE settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
- For LFXTDRIVE = {0}, $C_{L,eff}$ = 3.7 pF
- For LFXTDRIVE = {1}, $C_{L,eff}$ = 6 pF
- For LFXTDRIVE = {2}, 6 pF ≤ $C_{L,eff}$ ≤ 9 pF
- For LFXTDRIVE = {3}, 9 pF ≤ $C_{L,eff}$ ≤ 12.5 pF

(5) This represents all the parasitic capacitance present at the LFXIN and LFXOUT terminals, respectively, including parasitic bond and package capacitance. The effective load capacitance, $C_{L,eff}$ can be computed as C_{IN} x C_{OUT} / (C_{IN} + C_{OUT}), where C_{IN} and C_{OUT} is the total capacitance at the LFXIN and LFXOUT terminals, respectively.

(6) Requires external capacitors at both terminals. Values are specified by crystal manufacturers. Recommended values supported are 3.7 pF, 6 pF, 9 pF, and 12.5 pF. Maximum shunt capacitance of 1.6 pF. The PCB adds additional capacitance, so it must also be considered in the overall capacitance. Verify that the recommended effective load capacitance of the selected crystal is met.

(1) To improve EMI on the HFXT oscillator the following guidelines should be observed.
 • Keep the traces between the device and the crystal as short as possible.
 • Design a good ground plane around the oscillator pins.
 • Prevent crosstalk from other clock or data lines into oscillator pins HFXIN and HFXOUT.
 • Avoid running PCB traces underneath or adjacent to the HFXIN and HFXOUT pins.
 • Use assembly materials and processes that avoid any parasitic load on the oscillator HFXIN and HFXOUT pins.
 • If conformal coating is used, ensure that it does not induce capacitive/resistive leakage between the oscillator pins.
(2) HFFREQ = {0} is not supported for HFXT crystal mode of operation.
(3) Maximum frequency of operation of the entire device cannot be exceeded.

Table 5-5. High-Frequency Crystal Oscillator, HFXT[1] (continued)

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
$f_{HFXT,SW}$	HFXT oscillator logic-level square-wave input frequency, bypass mode	HFXTBYPASS = 1, HFFREQ = 0[4] [3]		0.9		4	MHz
		HFXTBYPASS = 1, HFFREQ = 1[4] [3]		4.01		8	
		HFXTBYPASS = 1, HFFREQ = 2[4] [3]		8.01		16	
		HFXTBYPASS = 1, HFFREQ = 3[4] [3]		16.01		24	
$DC_{HFXT,SW}$	HFXT oscillator logic-level square-wave input duty cycle	HFXTBYPASS = 1		40%		60%	
OA_{HFXT}	Oscillation allowance for HFXT crystals[5]	HFXTBYPASS = 0, HFXTDRIVE = 0, HFFREQ = 1[2], $f_{HFXT,HF}$ = 4 MHz, $C_{L,eff}$ = 16 pF			450		Ω
		HFXTBYPASS = 0, HFXTDRIVE = 1, HFFREQ = 1, $f_{HFXT,HF}$ = 8 MHz, $C_{L,eff}$ = 16 pF			320		
		HFXTBYPASS = 0, HFXTDRIVE = 2, HFFREQ = 2, $f_{HFXT,HF}$ = 16 MHz, $C_{L,eff}$ = 16 pF			200		
		HFXTBYPASS = 0, HFXTDRIVE = 3, HFFREQ = 3, $f_{HFXT,HF}$ = 24 MHz, $C_{L,eff}$ = 16 pF			200		
$t_{START,HFXT}$	Start-up time[6]	f_{OSC} = 4 MHz, HFXTBYPASS = 0, HFXTDRIVE = 0, HFFREQ = 1, T_A = 25°C, $C_{L,eff}$ = 16 pF	3.0 V		1.6		ms
		f_{OSC} = 24 MHz, HFXTBYPASS = 0, HFXTDRIVE = 3, HFFREQ = 3, T_A = 25°C, $C_{L,eff}$ = 16 pF	3.0 V		0.6		
C_{HFXIN}	Integrated load capacitance at HFXIN terminal[7] [8]				2		pF
C_{HFXOUT}	Integrated load capacitance at HFXOUT terminal[7] [8]				2		pF
$f_{Fault,HFXT}$	Oscillator fault frequency[9] [10]			0		800	kHz

(4) When HFXTBYPASS is set, HFXT circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this data sheet. Duty cycle requirements are defined by $DC_{HFXT,SW}$.
(5) Oscillation allowance is based on a safety factor of 5 for recommended crystals.
(6) Includes start-up counter of 1024 clock cycles.
(7) This represents all the parasitic capacitance present at the HFXIN and HFXOUT terminals, respectively, including parasitic bond and package capacitance. The effective load capacitance, $C_{L,eff}$ can be computed as $C_{IN} \times C_{OUT} / (C_{IN} + C_{OUT})$, where C_{IN} and C_{OUT} is the total capacitance at the HFXIN and HFXOUT terminals, respectively.
(8) Requires external capacitors at both terminals. Values are specified by crystal manufacturers. Recommended values supported are 14 pF, 16 pF, and 18 pF. Maximum shunt capacitance of 7 pF. The PCB adds additional capacitance, so it must also be considered in the overall capacitance. Verify that the recommended effective load capacitance of the selected crystal is met.
(9) Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX might set the flag. A static condition or stuck at fault condition will set the flag.
(10) Measured with logic-level input frequency but also applies to operation with crystals.

5.12.4 Wake-up Characteristics

Table 5-9 lists the device wake-up times.

Table 5-9. Wake-up Times From Low-Power Modes and Reset

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
$t_{WAKE-UP\ FRAM}$	Additional wake-up time to activate the FRAM in AM if previously disabled by the FRAM controller or from an LPM if immediate activation is selected				6	10	µs
$t_{WAKE-UP\ LPM0}$	Wake-up time from LPM0 to active mode	MCLKREQEN = 1 (1)	2.2 V, 3.0 V			400 ns + 1.5 / f_{DCO}	
		MCLKREQEN = 0 (1)(2)	2.2 V, 3.0 V			400 ns + 2.5 / f_{DCO}	
$t_{WAKE-UP\ LPM1}$	Wake-up time from LPM1 to active mode(1)		2.2 V, 3.0 V		6		µs
$t_{WAKE-UP\ LPM2}$	Wake-up time from LPM2 to active mode(1)		2.2 V, 3.0 V		6		µs
$t_{WAKE-UP\ LPM3}$	Wake-up time from LPM3 to active mode(1)		2.2 V, 3.0 V		7	10	µs
$t_{WAKE-UP\ LPM4}$	Wake-up time from LPM4 to active mode(1)		2.2 V, 3.0 V		7	10	µs
$t_{WAKE-UP\ LPM3.5}$	Wake-up time from LPM3.5 to active mode(3)		2.2 V, 3.0 V		250	350	µs
$t_{WAKE-UP\ LPM4.5}$	Wake-up time from LPM4.5 to active mode(3)	SVSHE = 1	2.2 V, 3.0 V		250	350	µs
		SVSHE = 0	2.2 V, 3.0 V		0.4	0.8	ms
$t_{WAKE-UP-RST}$	Wake-up time from a $\overline{RST}$ pin triggered reset to active mode(3)		2.2 V, 3.0 V		250	350	µs
$t_{WAKE-UP-BOR}$	Wake-up time from power-up to active mode (3)		2.2 V, 3.0 V		0.5	1.0	ms

(1) The wake-up time is measured from the edge of an external wake-up signal (for example, port interrupt or wake-up event) to the first externally observable MCLK clock edge with MCLKREQEN = 1. This time includes the activation of the FRAM during wakeup.
(2) With MCLKREQEN = 0, the MCLK is gated one additoinal one clock cycle (wake from LPM0, LPM1, LPM2, LPM3, and LPM4). The device wake-up time is not affected by the status of the MCLKREQEN bit.
(3) The wake-up time is measured from the edge of an external wake-up signal (for example, port interrupt or wake-up event) until the first instruction of the user program is executed.
Table 5-10 lists the typical charge required for wakeup.

Table 5-10. Typical Wake-up Charge(1)

| PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$Q_{WAKE-UP\ FRAM}$	Charge used for activating the FRAM in AM or during wakeup from LPM0 if previously disabled by the FRAM controller.			15.1		nAs
$Q_{WAKE-UP\ LPM0}$	Charge used to wake up from LPM0 to active mode (with FRAM active)			4.4		nAs
$Q_{WAKE-UP\ LPM1}$	Charge used to wake up from LPM1 to active mode (with FRAM active)			15.1		nAs
$Q_{WAKE-UP\ LPM2}$	Charge used to wake up from LPM2 to active mode (with FRAM active)			15.3		nAs
$Q_{WAKE-UP\ LPM3}$	Charge used to wake up from LPM3 to active mode (with FRAM active)			16.5		nAs
$Q_{WAKE-UP\ LPM4}$	Charge used to wake up from LPM4 to active mode (with FRAM active)			16.5		nAs
$Q_{WAKE-UP\ LPM3.5}$	Charge used to wake up from LPM3.5 to active mode(2)			76		nAs
$Q_{WAKE-UP\ LPM4.5}$	Charge used to wake up from LPM4.5 to active mode(2)	SVSHE = 1		77		nAs
		SVSHE = 0		77.5		
$Q_{WAKE-UP-RESET}$	Charge used for reset from $\overline{RST}$ or BOR event to active mode(2)			75		nAs

(1) Charge used during the wake-up time from a given low-power mode to active mode. This does not include the energy required in active mode (for example, for an interrupt service routine).
(2) Charge required until start of user code. This does not include the energy required to reconfigure the device.

5.12.5 Digital I/Os

Table 5-11 lists the characteristics of the digital inputs.

Table 5-11. Digital Inputs

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
V_{IT+}	Positive-going input threshold voltage		2.2 V	1.2		1.65	V
			3.0 V	1.65		2.25	
V_{IT-}	Negative-going input threshold voltage		2.2 V	0.55		1.00	V
			3.0 V	0.75		1.35	
V_{hys}	Input voltage hysteresis ($V_{IT+} - V_{IT-}$)		2.2 V	0.44		0.98	V
			3.0 V	0.60		1.30	
R_{Pull}	Pullup or pulldown resistor	For pullup: $V_{IN} = V_{SS}$ For pulldown: $V_{IN} = V_{CC}$		20	35	50	kΩ
$C_{I,dig}$	Input capacitance, digital only port pins	$V_{IN} = V_{SS}$ or V_{CC}			3		pF
$C_{I,ana}$	Input capacitance, port pins with shared analog functions[1]	$V_{IN} = V_{SS}$ or V_{CC}			5		pF
$I_{lkg(Px.y)}$	High-impedance input leakage current	See [2][3]	2.2 V, 3.0 V	−20		+20	nA
$t_{(int)}$	External interrupt timing (external trigger pulse duration to set interrupt flag)[4]	Ports with interrupt capability (see block diagram and terminal function descriptions).	2.2 V, 3.0 V	20			ns
$t_{(RST)}$	External reset pulse duration on $\overline{RST}$[5]		2.2 V, 3.0 V	2			µs

(1) If the port pins PJ.4/LFXIN and PJ.5/LFXOUT are used as digital I/Os, they are connected by a 4-pF capacitor and a 35-MΩ resistor in series. At frequencies of approximately 1 kHz and lower, the 4-pF capacitor can add to the pin capacitance of PJ.4/LFXIN and PJ.5/LFXOUT.
(2) The input leakage current is measured with V_{SS} or V_{CC} applied to the corresponding pins, unless otherwise noted.
(3) The input leakage of the digital port pins is measured individually. The port pin is selected for input and the pullup or pulldown resistor is disabled.
(4) An external signal sets the interrupt flag every time the minimum interrupt pulse duration $t_{(int)}$ is met. It may be set by trigger signals shorter than $t_{(int)}$.
(5) Not applicable if the $\overline{RST}$/NMI pin is configured as NMI.

Table 5-12 lists the characteristics of the digital outputs.

Table 5-12. Digital Outputs

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
V_{OH}	High-level output voltage	$I_{(OHmax)} = -1$ mA[1]	2.2 V	$V_{CC} - 0.25$		V_{CC}	V
		$I_{(OHmax)} = -3$ mA[2]		$V_{CC} - 0.60$		V_{CC}	
		$I_{(OHmax)} = -2$ mA[1]	3.0 V	$V_{CC} - 0.25$		V_{CC}	
		$I_{(OHmax)} = -6$ mA[2]		$V_{CC} - 0.60$		V_{CC}	
V_{OL}	Low-level output voltage	$I_{(OLmax)} = 1$ mA[1]	2.2 V	V_{SS}		$V_{SS} + 0.25$	V
		$I_{(OLmax)} = 3$ mA[2]		V_{SS}		$V_{SS} + 0.60$	
		$I_{(OLmax)} = 2$ mA[1]	3.0 V	V_{SS}		$V_{SS} + 0.25$	
		$I_{(OLmax)} = 6$ mA[2]		V_{SS}		$V_{SS} + 0.60$	
$f_{Px.y}$	Port output frequency (with load)[3]	$C_L = 20$ pF, R_L [4] [5]	2.2 V	16			MHz
			3.0 V	16			
f_{Port_CLK}	Clock output frequency[3]	ACLK, MCLK, or SMCLK at configured output port $C_L = 20$ pF[5]	2.2 V	16			MHz
			3.0 V	16			
$t_{rise,dig}$	Port output rise time, digital only port pins	$C_L = 20$ pF	2.2 V		4	15	ns
			3.0 V		3	15	
$t_{fall,dig}$	Port output fall time, digital only port pins	$C_L = 20$ pF	2.2 V		4	15	ns
			3.0 V		3	15	
$t_{rise,ana}$	Port output rise time, port pins with shared analog functions	$C_L = 20$ pF	2.2 V		6	15	ns
			3.0 V		4	15	
$t_{fall,ana}$	Port output fall time, port pins with shared analog functions	$C_L = 20$ pF	2.2 V		6	15	ns
			3.0 V		4	15	

(1) The maximum total current, $I_{(OHmax)}$ and $I_{(OLmax)}$, for all outputs combined should not exceed ±48 mA to hold the maximum voltage drop specified.
(2) The maximum total current, $I_{(OHmax)}$ and $I_{(OLmax)}$, for all outputs combined should not exceed ±100 mA to hold the maximum voltage drop specified.
(3) The port can output frequencies at least up to the specified limit. It might support higher frequencies.
(4) A resistive divider with 2 × R1 and R1 = 1.6 kΩ between V_{CC} and V_{SS} is used as load. The output is connected to the center tap of the divider. $C_L = 20$ pF is connected from the output to V_{SS}.
(5) The output voltage reaches at least 10% and 90% V_{CC} at the specified toggle frequency.

Table 5-14 lists the characteristics of the Timer_A.

Table 5-14. Timer_A

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
f_{TA}	Timer_A input clock frequency	Internal: SMCLK or ACLK, External: TACLK, Duty cycle = 50% ±10%	2.2 V, 3.0 V			16	MHz
$t_{TA,cap}$	Timer_A capture timing	All capture inputs, minimum pulse duration required for capture	2.2 V, 3.0 V	20			ns

Table 5-15 lists the characteristics of the Timer_B.

Table 5-15. Timer_B

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
f_{TB}	Timer_B input clock frequency	Internal: SMCLK or ACLK, External: TBCLK, Duty cycle = 50% ±10%	2.2 V, 3.0 V			16	MHz
$t_{TB,cap}$	Timer_B capture timing	All capture inputs, minimum pulse duration required for capture	2.2 V, 3.0 V	20			ns

5.12.7 eUSCI

Table 5-16 lists the supported clock frequencies for the eUSCI in UART mode.

Table 5-16. eUSCI (UART Mode) Clock Frequency

PARAMETER		CONDITIONS	V_{CC}	MIN	MAX	UNIT
f_{eUSCI}	eUSCI input clock frequency	Internal: SMCLK, ACLK External: UCLK Duty cycle = 50% ±10%			16	MHz
f_{BITCLK}	BITCLK clock frequency (equals baud rate in MBaud)				4	MHz

Table 5-17 lists the characteristics of the eUSCI in UART mode.

Table 5-17. eUSCI (UART Mode)

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
t_t	UART receive deglitch time[1]	UCGLITx = 0	2.2 V, 3.0 V	5		30	ns
		UCGLITx = 1		20		90	
		UCGLITx = 2		35		160	
		UCGLITx = 3		50		220	

(1) Pulses on the UART receive input (UCxRX) that are shorter than the UART receive deglitch time are suppressed. Thus the selected deglitch time can limit the maximum usable baud rate. To make sure that pulses are correctly recognized, their duration should exceed the maximum specification of the deglitch time.

Table 5-18 lists the supported clock frequencies for the eUSCI in SPI master mode.

Table 5-18. eUSCI (SPI Master Mode) Clock Frequency

PARAMETER		CONDITIONS	V$_{CC}$	MIN	MAX	UNIT
f$_{eUSCI}$	eUSCI input clock frequency	Internal: SMCLK, ACLK Duty cycle = 50% ±10%			16	MHz

Table 5-19 lists the characteristics of the eUSCI in SPI master mode.

Table 5-19. eUSCI (SPI Master Mode)

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)[1]

PARAMETER		TEST CONDITIONS	V$_{CC}$	MIN	TYP	MAX	UNIT
t$_{STE,LEAD}$	STE lead time, STE active to clock	UCSTEM = 1, UCMODEx = 01 or 10		1			UCxCLK cycles
t$_{STE,LAG}$	STE lag time, last clock to STE inactive	UCSTEM = 1, UCMODEx = 01 or 10		1			
t$_{STE,ACC}$	STE access time, STE active to SIMO data out	UCSTEM = 0, UCMODEx = 01 or 10	2.2 V, 3.0 V			60	ns
t$_{STE,DIS}$	STE disable time, STE inactive to SOMI high impedance	UCSTEM = 0, UCMODEx = 01 or 10	2.2 V, 3.0 V			80	ns
t$_{SU,MI}$	SOMI input data setup time		2.2 V	40			ns
			3.0 V	40			
t$_{HD,MI}$	SOMI input data hold time		2.2 V	0			ns
			3.0 V	0			
t$_{VALID,MO}$	SIMO output data valid time[2]	UCLK edge to SIMO valid, C$_L$ = 20 pF	2.2 V			10	ns
			3.0 V			10	
t$_{HD,MO}$	SIMO output data hold time[3]	C$_L$ = 20 pF	2.2 V		0		ns
			3.0 V		0		

(1)   f$_{UCxCLK}$ = 1 / 2t$_{LO/HI}$ with tL$_{O/HI}$ = max(t$_{VALID,MO(eUSCI)}$ + t$_{SU,SI(Slave)}$, t$_{SU,MI(eUSCI)}$ + t$_{VALID,SO(Slave)}$).
        For the slave parameters t$_{SU,SI(Slave)}$ and t$_{VALID,SO(Slave)}$, see the SPI parameters of the attached slave.
(2)   Specifies the time to drive the next valid data to the SIMO output after the output changing UCLK clock edge. See the timing diagrams in Figure 5-14 and Figure 5-15.
(3)   Specifies how long data on the SIMO output is valid after the output changing UCLK clock edge. Negative values indicate that the data on the SIMO output can become invalid before the output changing clock edge observed on UCLK. See the timing diagrams in Figure 5-14 and Figure 5-15.

5.12.8 ADC12

Table 5-22 lists the power supply and input range conditions for the ADC.

Table 5-22. 12-Bit ADC, Power Supply and Input Range Conditions

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	NOM	MAX	UNIT
V(Ax)	Analog input voltage[1]	All ADC12 analog input pins Ax		0		AVCC	V
I(ADC12_B) single-ended mode	Operating supply current into AVCC plus DVCC terminal[2] [3]	$f_{ADC12CLK}$ = MODCLK, ADC12ON = 1, ADC12PWRMD = 0, ADC12DIF = 0 REFON = 0, ADC12SHTx = 0, ADC12DIV = 0	3.0 V		145	199	μA
			2.2 V		140	190	
I(ADC12_B) differential mode	Operating supply current into AVCC and DVCC terminals[2] [3]	$f_{ADC12CLK}$ = MODCLK, ADC12ON = 1, ADC12PWRMD = 0, ADC12DIF = 1 REFON = 0, ADC12SHTx = 0, ADC12DIV = 0	3.0 V		175	245	μA
			2.2 V		170	230	
C_I	Input capacitance	Only one terminal Ax can be selected at one time	2.2 V		10	15	pF
R_I	Input MUX ON resistance	0 V ≤ V(Ax) ≤ AVCC	>2 V		0.5	4	kΩ
			<2 V		1	10	

(1) The analog input voltage range must be within the selected reference voltage range V_{R+} to V_{R-} for valid conversion results.
(2) The internal reference supply current is not included in current consumption parameter I(ADC12_B).
(3) Typically about 60% of the total current into the AVCC and DVCC terminal is from AVCC.

Table 5-23 lists the timing parameter for the ADC.

Table 5-23. 12-Bit ADC, Timing Parameters

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$f_{ADC12CLK}$	Specified performance	For specified performance of ADC12 linearity parameters with ADC12PWRMD = 0, If ADC12PWRMD = 1, the maximum is 1/4 of the value shown here	0.45		5.4	MHz
$f_{ADC12CLK}$	Reduced performance	Linearity parameters have reduced performance		32.768		kHz
$f_{ADC12OSC}$	Internal oscillator[1]	ADC12DIV = 0, $f_{ADC12CLK}$ = $f_{ADC12OSC}$ from MODCLK	4	4.8	5.4	MHz
$t_{CONVERT}$	Conversion time	REFON = 0, Internal oscillator, $f_{ADC12CLK}$ = $f_{ADC12OSC}$ from MODCLK, ADC12WINC = 0	2.6		3.5	μs
		External $f_{ADC12CLK}$ from ACLK, MCLK, or SMCLK, ADC12SSEL ≠ 0		(2)		
$t_{ADC12ON}$	Turnon settling time of the ADC	See [3]			100	ns
$t_{ADC12OFF}$	Time ADC must be off before can be turned on again	$t_{ADC12OFF}$ must be met to make sure $t_{ADC12ON}$ time holds	100			ns

(1) The ADC12OSC is sourced directly from MODOSC inside the UCS.
(2) 14 × 1 / $f_{ADC12CLK}$. If ADC12WINC = 1, then 15 × 1 / $f_{ADC12CLK}$
(3) The condition is that the error in a conversion started after $t_{ADC12ON}$ is less than ±0.5 LSB. The reference and input signals are already settled.

SLASE66C – APRIL 2015 – REVISED AUGUST 2018

Table 5-23. 12-Bit ADC, Timing Parameters (continued)

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
t_{Sample}	Sampling time	$R_S = 400\ \Omega$, $R_I = 4\ k\Omega$, $C_I = 15\ pF$, $C_{pext} = 8\ pF$ [4]	All pulse sample mode (ADC12SHP = 1) and extended sample mode (ADC12SHP = 0) with buffered reference (ADC12 VRSEL = 0x1, 0x3, 0x5, 0x7, 0x9, 0xB, 0xD, 0xF)	1			µs
			Extended sample mode (ADC12SHP = 0) with unbuffered reference (ADC12 VRSEL= 0x0, 0x2, 0x4, 0x6, 0xC, 0xE)	[5]			µs

(4)   Approximately 10 Tau (τ) are needed to get an error of less than ±0.5 LSB: $t_{sample} = \ln(2^{n+2}) \times (R_S + R_I) \times (C_I + C_{pext})$, $R_S < 10\ k\Omega$, where n = ADC resolution = 12, R_S= external source resistance, C_{pext} = external parasitic capacitance.
(5) $6 \times (1 / f_{ADC12CLK})$

Table 5-24 lists the linearity parameters of the ADC when using an external reference.

Table 5-24. 12-Bit ADC, Linearity Parameters With External Reference[1]

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Resolution	Number of no missing code output-code bits		12			bits
E_I	Integral linearity error (INL) for differential input	$1.2\ V \le V_{R+} - V_{R-} \le AV_{CC}$			±1.8	LSB
E_I	Integral linearity error (INL) for single ended inputs	$1.2\ V \le V_{R+} - V_{R-} \le AV_{CC}$			±2.2	LSB
E_D	Differential linearity error (DNL)		−0.99		+1.0	LSB
E_O	Offset error [2] [3]	ADC12 VRSEL = 0x2 or 0x4 without TLV calibration, TLV calibration data can be used to improve the parameter [4]		±0.5	±1.5	mV
$E_{G,ext}$	Gain error	With external voltage reference without internal buffer (ADC12 VRSEL = 0x2 or 0x4) without TLV calibration, TLV calibration data can be used to improve the parameter [4], $V_{R+} = 2.5\ V$, $V_{R-} = AVSS$		±0.8	±2.5	LSB
		With external voltage reference with internal buffer (ADC12 VRSEL = 0x3), $V_{R+} = 2.5\ V$, $V_{R-} = AVSS$		±1	±20	
$E_{T,ext}$	Total unadjusted error	With external voltage reference without internal buffer (ADC12 VRSEL = 0x2 or 0x4) without TLV calibration, TLV calibration data can be used to improve the parameter [4], $V_{R+} = 2.5\ V$, $V_{R-} = AVSS$		±1.4	±3.5	LSB
		With external voltage reference with internal buffer (ADC12 VRSEL = 0x3), $V_{R+} = 2.5\ V$, $V_{R-} = AVSS$		±1.4	±21.0	

(1)   See Table 5-26 and Table 5-32 for more information on internal reference performance and see *Designing With the MSP430FR58xx, FR59xx, FR68xx, and FR69xx ADC* for details on optimizing ADC performance for your application with the choice of internal versus external reference.
(2)   Offset is measured as the input voltage (at which ADC output transitions from 0 to 1) minus 0.5 LSB.
(3)   Offset increases as I_R drop increases when V_{R-} is AVSS.
(4)   For details, see the device descriptor table section in the *MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide*.

Table 5-30 lists the temperature sensor and built-in $V_{1/2}$ characteristics.

Table 5-30. 12-Bit ADC, Temperature Sensor and Built-In $V_{1/2}$

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
V_{SENSOR}	See [1] [2]	ADC12ON = 1, ADC12TCMAP = 1, T_A = 0°C (see Figure 5-19)			700		mV
TC_{SENSOR}	See [2]	ADC12ON = 1, ADC12TCMAP = 1			2.5		mV/°C
$t_{SENSOR(sample)}$	Sample time required if ADCTCMAP = 1 and channel (MAX – 1) is selected[3]	ADC12ON = 1, ADC12TCMAP = 1, Error of conversion result ≤ 1 LSB		30			µs
$V_{1/2}$	AVCC voltage divider for ADC12BATMAP = 1 on MAX input channel	ADC12ON = 1, ADC12BATMAP = 1		47.5%	50%	52.5%	
$I_{V\,1/2}$	current for battery monitor during sample time	ADC12ON = 1, ADC12BATMAP = 1			38	72	µA
$t_{V\,1/2\,(sample)}$	Sample time required if ADC12BATMAP = 1 and channel MAX is selected[4]	ADC12ON = 1, ADC12BATMAP = 1		1.7			µs

(1) The temperature sensor offset can be as much as ±30°C. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor.
(2) The device descriptor structure contains calibration values for 30°C ±3°C and 85°C ±3°C for each of the available reference voltage levels. The sensor voltage can be computed as $V_{SENSE} = TC_{SENSOR}$ * (Temperature, °C) + V_{SENSOR}, where TC_{SENSOR} and V_{SENSOR} can be computed from the calibration values for higher accuracy.
(3) The typical equivalent impedance of the sensor is 250 kΩ. The sample time required includes the sensor on-time $t_{SENSOR(on)}$.
(4) The on-time $t_{V\,1/2(on)}$ is included in the sampling time $t_{V\,1/2\,(sample)}$; no additional on time is needed.

Table 5-31 lists the external reference characteristics of the ADC.

Table 5-31. 12-Bit ADC, External Reference[1]

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
V_{R+}	Positive external reference voltage input VeREF+ or VeREF- based on ADC12 VRSEL bit	$V_{R+} > V_{R-}$	1.2	AV_{CC}	V
V_{R-}	Negative external reference voltage input VeREF+ or VeREF- based on ADC12 VRSEL bit	$V_{R+} > V_{R-}$	0	1.2	V
$(V_{R+} - V_{R-})$	Differential external reference voltage input	$V_{R+} > V_{R-}$	1.2	AV_{CC}	V
I_{VeREF+} I_{VeREF-}	Static input current singled ended input mode	$1.2\ V \le V_{eREF+} \le V_{AVCC}$, $V_{eREF-} = 0\ V$ $f_{ADC12CLK}$ = 5 MHz, ADC12SHTx = 1h, ADC12DIF = 0, ADC12PWRMD = 0		±10	µA
		$1.2\ V \le V_{eREF+} \le V_{AVCC}$, $V_{eREF-} = 0\ V$ $f_{ADC12CLK}$ = 5 MHz, ADC12SHTx = 8h, ADC12DIF = 0, ADC12PWRMD = 01		±2.5	
I_{VeREF+} I_{VeREF-}	Static input current differential input mode	$1.2\ V \le V_{eREF+} \le V_{AVCC}$, $V_{eREF-} = 0\ V$ $f_{ADC12CLK}$ = 5 MHz, ADC12SHTx = 1h, ADC12DIF = 1, ADC12PWRMD = 0		±20	uA
		$1.2\ V \le V_{eREF+} \le V_{AVCC}$, $V_{eREF-} = 0\ V$ $f_{ADC12CLK}$ = 5 MHz, ADC12SHTx = 8h, ADC12DIF = 1, ADC12PWRMD = 1		±5	
I_{VeREF+}	Peak input current with single ended input	$0\ V \le V_{eREF+} \le V_{AVCC}$, ADC12DIF = 0		1.5	mA
I_{VeREF+}	Peak input current with differential input	$0\ V \le V_{eREF+} \le V_{AVCC}$, ADC12DIF = 1		3	mA
$C_{VeREF+/-}$	Capacitance at VeREF+ or VeREF- terminal	See [2]	10		µF

(1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance, C_I, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 12-bit accuracy.

(2) Two decoupling capacitors, 10 µF and 470 nF, should be connected to VeREF to decouple the dynamic current required for an external reference source if it is used for the ADC12_B. See also the *MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide*.

		ADC OFF, REFON = 1, REFOUT = 1, REFVSEL = {0, 1, 2}			1085	1780	
$I_{O(VREF+)}$	VREF maximum load current, VREF+ terminal	REFVSEL = {0, 1, 2}, AVCC = AVCC(min) for each reference level, REFON = REFOUT = 1		−1000		+10	µA
ΔVout/ΔIo (VREF+)	Load-current regulation, VREF+ terminal	REFVSEL = {0, 1, 2}, $I_{O(VREF+)}$ = +10 µA or −1000 µA, AV_{CC} = $AV_{CC(min)}$ for each reference level, REFON = REFOUT = 1				2500	µV/mA
$C_{VREF+/-}$	Capacitance at VREF+ and VREF- terminals	REFON = REFOUT = 1		0		100	pF
TC_{REF+}	Temperature coefficient of built-in reference	REFVSEL = {0, 1, 2}, REFON = REFOUT = 1, T_A = −40°C to 85°C[4]			18	50	ppm/K
PSRR_DC	Power supply rejection ratio (DC)	AV_{CC} = $AV_{CC(min)}$ to $AV_{CC(max)}$, T_A = 25°C, REFVSEL = {0, 1, 2}, REFON = REFOUT = 1			120	400	µV/V
PSRR_AC	Power supply rejection ratio (AC)	dAV_{CC}= 0.1 V at 1 kHz			3.0		mV/V
t_{SETTLE}	Settling time of reference voltage[5]	AV_{CC} = $AV_{CC\ (min)}$ to $AV_{CC(max)}$, REFVSEL = {0, 1, 2}, REFON = 0 → 1			75	80	µs

(1) Internal reference noise affects ADC performance when ADC uses internal reference. See *Designing With the MSP430FR59xx and MSP430FR58xx ADC* for details on optimizing ADC performance for your application with the choice of internal versus external reference.
(2) Buffer offset affects ADC gain error and thus total unadjusted error.
(3) The internal reference current is supplied through the AVCC terminal.
(4) Calculated using the box method: (MAX(−40°C to 85°C) − MIN(−40°C to 85°C)) / MIN(−40°C to 85°C)/(85°C − (−40°C)).
(5) The condition is that the error in a conversion started after t_{REFON} is less than ±0.5 LSB.

5.12.11 FRAM Controller

Table 5-34 lists the characteristics of the FRAM.

Table 5-34. FRAM

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
	Read and write endurance		10^{15}			cycles
$t_{Retention}$	Data retention duration	$T_J = 25°C$	100			years
		$T_J = 70°C$	40			
		$T_J = 85°C$	10			
I_{WRITE}	Current to write into FRAM			I_{READ}[1]		nA
I_{ERASE}	Erase current			N/A[2]		nA
t_{WRITE}	Write time			t_{READ}[3]		ns
t_{READ}	Read time, NWAITSx = 0			$1 / f_{SYSTEM}$[4]		ns
	Read time, NWAITSx = 1			$2 / f_{SYSTEM}$[4]		

(1) Writing to FRAM does not require a setup sequence or additional power when compared to reading from FRAM. The FRAM read current I_{READ} is included in the active mode current consumption numbers $I_{AM,FRAM}$.
(2) N/A = not applicable. FRAM does not require a special erase sequence.
(3) Writing into FRAM is as fast as reading.
(4) The maximum read (and write) speed is specified by f_{SYSTEM} using the appropriate wait state settings (NWAITSx).

5.12.12 Emulation and Debug

Table 5-35 lists the characteristics of the JTAG and Spy-Bi-Wire interface.

Table 5-35. JTAG and Spy-Bi-Wire Interface

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{JTAG}	Supply current adder when JTAG active (but not clocked)	2.2 V, 3.0 V		40	100	µA
f_{SBW}	Spy-Bi-Wire input frequency	2.2 V, 3.0 V	0		10	MHz
$t_{SBW,Low}$	Spy-Bi-Wire low clock pulse duration	2.2 V, 3.0 V	0.04		15	µs
$t_{SBW, En}$	Spy-Bi-Wire enable time (TEST high to acceptance of first clock edge)[1]	2.2 V, 3.0 V			110	µs
$t_{SBW,Rst}$	Spy-Bi-Wire return to normal operation time		15		100	µs
f_{TCK}	TCK input frequency, 4-wire JTAG[2]	2.2 V	0		16	MHz
		3.0 V	0		16	MHz
$R_{internal}$	Internal pulldown resistance on TEST	2.2 V, 3.0 V	20	35	50	kΩ
f_{TCLK}	TCLK/MCLK frequency during JTAG access, no FRAM access (limited by f_{SYSTEM})				16	MHz
$t_{TCLK,Low/High}$	TCLK low or high clock pulse duration, no FRAM access				25	ns
$f_{TCLK,FRAM}$	TCLK/MCLK frequency during JTAG access, including FRAM access (limited by f_{SYSTEM} with no FRAM wait states)				4	MHz
$t_{TCLK,FRAM,Low/High}$	TCLK low or high clock pulse duration, including FRAM accesses				100	ns

(1) Tools that access the Spy-Bi-Wire and BSL interfaces must wait for the $t_{SBW,En}$ time after the first transition of the TEST/SBWTCK pin (low to high), before the second transition of the pin (high to low) during the entry sequence.
(2) f_{TCK} may be restricted to meet the timing requirements of the module selected.

6 Detailed Description

6.1 Overview

The Texas Instruments MSP430FR597x(1) and MSP430FR587x(1) family of ultra-low-power microcontrollers consists of several devices featuring different sets of peripherals. The architecture, combined with seven low-power modes is optimized to achieve extended battery life for example in portable measurement applications. The devices features a powerful 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency. The devices are microcontroller configurations with up to five 16-bit timers, a comparator, eUSCIs that support UART, SPI, and I^2C, a hardware multiplier, an AES accelerator, DMA, an RTC module with alarm capabilities, up to 52 I/O pins, and a high-performance 12-bit ADC.

6.2 CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses, and can be handled with all instructions.

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data. CPUxV2 can also operate on address-word data (20-bit).

MSP430FR5872 MSP430FR58721 MSP430FR5870

6.3 Operating Modes

The device has one active mode and seven software selectable low-power modes of operation (see Table 6-1). An interrupt event can wake up the device from low-power modes LPM0 to LPM4, service the request, and restore back to the low-power mode on return from the interrupt program. Low-power modes LPM3.5 and LPM4.5 disable the core supply to minimize power consumption.

Table 6-1. Operating Modes

MODE	AM		LPM0	LPM1	LPM2	LPM3	LPM4	LPM3.5	LPM4.5	
	Active	Active, FRAM Off [1]	CPU Off [2]	CPU Off	Standby	Standby	Off	RTC Only	Shutdown With SVS	Shutdown Without SVS
Maximum system clock	16 MHz		16 MHz	16 MHz	50 kHz	50 kHz	0 [3]	50 kHz	0 [3]	
Typical current consumption, 25°C	103 µA/MHz	65 µA/MHz	75 µA at 1 MHz	40 µA at 1 MHz	0.9 µA	0.4 µA	0.3 µA	0.35 µA	0.2 µA	0.02 µA
Typical wake-up time	N/A		instant.	6 µs	6 µs	7 µs	7 µs	250 µs	250 µs	1000 µs
Wake-up events	N/A		all	all	LF RTC I/O Comp	LF RTC I/O Comp	I/O Comp	RTC I/O	I/O	
CPU	on		off	off	off	off	off	reset	reset	
FRAM	on	off [1]	standby (or off [1])	off	off	off	off	off	off	
High-frequency peripherals	available		available	available	off	off	off	reset	reset	
Low-frequency peripherals	available		available	available	available	available [4]	off	RTC	reset	
Unclocked peripherals [5]	available		available	available	available	available [4]	available [4]	reset	reset	
MCLK	on		off	off	off	off	off	off	off	
SMCLK	opt. [6]		opt. [6]	opt. [6]	off	off	off	off	off	
ACLK	on		on	on	on	on	off	off	off	
Full retention	yes		yes	yes	yes	yes [7]	yes [7]	no	no	
SVS	always		always	always	optional [8]	optional [8]	optional [8]	optional [8]	on [9]	off [10]
Brownout	always		always	always	always	always	always	always	always	

(1) FRAM disabled in FRAM controller
(2) Disabling the FRAM through the FRAM controller decreases the LPM current consumption, but the wake-up time can increase. If the wakeup is for FRAM access (for example, to fetch an interrupt vector), wake-up time is increased. If the wakeup is for an operation that does not access FRAM (for example, DMA transfer to RAM), wake-up time is not increased.
(3) All clocks disabled
(4) See Section 6.3.2, which describes the use of peripherals in LPM3 and LPM4.
(5) "Unclocked peripherals" are peripherals that do not require a clock source to operate; for example, the comparator and REF, or the eUSCI when operated as an SPI slave.
(6) Controlled by SMCLKOFF
(7) Using the RAM Controller, the RAM can be completely powered down to save leakage; however, all data is lost.
(8) Activated SVS (SVSHE = 1) results in higher current consumption. SVS not included in typical current consumption.
(9) SVSHE = 1
(10) SVSHE = 0

6.3.1 Peripherals in Low-Power Modes

Peripherals can be in different states that affect which power mode the device can enter. The states depend on the operational modes of the peripherals (see Table 6-2). The states are:

- A peripheral is in a "high-frequency state" if it requires or uses a clock with a "high" frequency of more than 50 kHz.
- A peripheral is in a "low-frequency state" if it requires or uses a clock with a "low" frequency of 50 kHz or less.
- A peripheral is in an "unclocked state" if it does not require or use an internal clock.

If the CPU requests a power mode that does not support the current state of all active peripherals, the device does not enter the requested power mode. The device instead enters a power mode that still supports the current state of the peripherals, except if an external clock is used. If an external clock is used, the application must use the correct frequency range for the requested power mode.

Table 6-2. Peripheral States

PERIPHERAL	IN HIGH-FREQUENCY STATE[1]	IN LOW-FREQUENCY STATE[2]	IN UNCLOCKED STATE[3]
WDT	Clocked by SMCLK	Clocked by ACLK	Not applicable
DMA[4]	Not applicable	Not applicable	Waiting for a trigger
RTC_C	Not applicable	Clocked by LFXT	Not applicable
Timer_A TAx	Clocked by SMCLK or clocked by external clock >50 kHz	Clocked by ACLK or clocked by external clock ≤50 kHz	Clocked by external clock ≤50 kHz
Timer_B TBx	Clocked by SMCLK or clocked by external clock >50 kHz	Clocked by ACLK or clocked by external clock ≤50 kHz	Clocked by external clock ≤50 kHz
eUSCI_Ax in UART mode	Clocked by SMCLK	Clocked by ACLK	Waiting for first edge of START bit.
eUSCI_Ax in SPI master mode	Clocked by SMCLK	Clocked by ACLK	Not applicable
eUSCI_Ax in SPI slave mode	Clocked by external clock >50 kHz	Clocked by external clock ≤50 kHz	Clocked by external clock ≤50 kHz
eUSCI_Bx in I^{2}C master mode	Clocked by SMCLK or clocked by external clock >50 kHz	Clocked by ACLK or clocked by external clock ≤50 kHz	Not applicable
eUSCI_Bx in I^{2}C slave mode	Clocked by external clock >50 kHz	Clocked by external clock ≤50 kHz	Waiting for START condition or clocked by external clock ≤50 kHz
eUSCI_Bx in SPI master mode	Clocked by SMCLK	Clocked by ACLK	Not applicable
eUSCI_Bx in SPI slave mode	Clocked by external clock >50 kHz	Clocked by external clock ≤50 kHz	Clocked by external clock ≤50 kHz
ADC12_B	Clocked by SMCLK or by MODOSC	Clocked by ACLK	Waiting for a trigger
REF_A	Not applicable	Not applicable	Always
COMP_E	Not applicable	Not applicable	Always
CRC[5]	Not applicable	Not applicable	Not applicable
MPY[5]	Not applicable	Not applicable	Not applicable
AES[5]	Not applicable	Not applicable	Not applicable

(1) Peripherals are in a state that requires or uses a clock with a "high" frequency of more than 50 kHz.
(2) Peripherals are in a state that requires or uses a clock with a "low" frequency of 50 kHz or less.
(3) Peripherals are in a state that does not require or does not use an internal clock.
(4) The DMA always transfers data in active mode but can wait for a trigger in any low-power mode. A DMA trigger during a low-power mode causes a temporary transition into active mode for the time of the transfer.
(5) This peripheral operates during active mode only and delays the transition into a low-power mode until its operation is completed.

6.3.2 Idle Currents of Peripherals in LPM3 and LPM4

Most peripherals can be activated to be operational in LPM3 if clocked by ACLK. Some modules are even operational in LPM4 because they do not require a clock to operate (for example, the comparator). Activating a peripheral in LPM3 or LPM4 increases the current consumption due to its active supply current contribution but also due to an additional idle current. To limit the idle current adder, certain peripherals are group together. To achieve optimal current consumption, try to use modules within one group and to limit the number of groups with active modules. Table 6-3 lists the grouping. Modules not listed in this table are either already included in the standard LPM3 current consumption specifications or cannot be used in LPM3 or LPM4.

The idle current adder is very small at room temperature (25°C) but increases at high temperatures (85°C); see the I_{IDLE} current parameters in Section 5.7 for details.

Table 6-3. Peripheral Groups

Group A	Group B	Group C
Timer TA0	Timer TA2	Timer TA3
Timer TA1	Timer B0	eUSCI_A1
Comparator	eUSCI_A0	
ADC12_B	eUSCI_B0	
REF_A	eUSCI_B1	

6.4 Interrupt Vector Table and Signatures

The interrupt vectors, the power-up start address, and signatures are in the address range 0FFFFh to 0FF80h. Table 6-4 summarizes the content of this address range.

The power-up start address or reset vector is at 0FFFFh to 0FFFEh. It contains the 16-bit address pointing to the start address of the application program.

The interrupt vectors start at 0FFFDh extending to lower addresses. Each vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

The vectors programmed into the address range from 0FFFFh to 0FFE0h are used as BSL password (if enabled by the corresponding signature)

The signatures are at 0FF80h extending to higher addresses. Signatures are evaluated during device start-up. Starting from address 0FF88h extending to higher addresses a JTAG password can programmed. The password can extend into the interrupt vector locations using the interrupt vector addresses as additional bits for the password.

See the chapter *System Resets, Interrupts, and Operating Modes, System Control Module (SYS)* in the *MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide* for details.

6.5 Bootloader (BSL)

The BSL enables programming of the FRAM or RAM using a UART serial interface (FRxxxx devices) or an I^2C interface (FRxxxx1 devices). Access to the device memory through the BSL is protected by an user-defined password. Use of the BSL requires four pins as shown in Table 6-5. BSL entry requires a specific entry sequence on the $\overline{RST}$/NMI/SBWTDIO and TEST/SBWTCK pins. For complete description of the features of the BSL and its implementation, see *MSP430 FRAM Device Bootloader (BSL) User's Guide*
.

Table 6-5. BSL Pin Requirements and Functions

DEVICE SIGNAL	BSL FUNCTION
$\overline{RST}$/NMI/SBWTDIO	Entry sequence signal
TEST/SBWTCK	Entry sequence signal
BSL_TX	Devices with UART BSL (FRxxxx): Data transmit
BSL_RX	Devices with UART BSL (FRxxxx): Data receive
BSL_DAT	Devices with I^2C BSL (FRxxxx1): Data
BSL_CLK	Devices with I^2C BSL (FRxxxx1): Clock
VCC	Power supply
VSS	Ground supply

6.6 JTAG Operation

6.6.1 JTAG Standard Interface

The MSP430 family supports the standard JTAG interface, which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin is used to enable the JTAG signals. In addition to these signals, the $\overline{RST}$/NMI/SBWTDIO is required to interface with MSP430 development tools and device programmers. Table 6-6 lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*. For a complete description of the features of the JTAG interface and its implementation, see *MSP430 Programming With the JTAG Interface*.

Table 6-6. JTAG Pin Requirements and Functions

DEVICE SIGNAL	DIRECTION	FUNCTION
PJ.3/TCK	IN	JTAG clock input
PJ.2/TMS	IN	JTAG state control
PJ.1/TDI/TCLK	IN	JTAG data input, TCLK input
PJ.0/TDO	OUT	JTAG data output
TEST/SBWTCK	IN	Enable JTAG pins
$\overline{RST}$/NMI/SBWTDIO	IN	External reset
VCC		Power supply
VSS		Ground supply

6.6.2 Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the MSP430 family supports the 2-wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. Table 6-7 lists the Spy-Bi-Wire interface pin requirements. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*.

Table 6-7. Spy-Bi-Wire Pin Requirements and Functions

DEVICE SIGNAL	DIRECTION	FUNCTION
TEST/SBWTCK	IN	Spy-Bi-Wire clock input
RST/NMI/SBWTDIO	IN, OUT	Spy-Bi-Wire data input/output
VCC		Power supply
VSS		Ground supply

6.7 FRAM

The FRAM can be programmed through the JTAG port, Spy-Bi-Wire (SBW), the BSL, or in-system by the CPU. Features of the FRAM include:

- Ultra-low-power ultra-fast-write nonvolatile memory
- Byte and word access capability
- Programmable and automated wait-state generation
- Error correction coding (ECC)

NOTE

Wait States

For MCLK frequencies > 8 MHz, wait states must be configured following the flow described in the "Wait State Control" section of the "FRAM Controller (FRCTRL)" chapter in the *MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide*.

For important software design information regarding FRAM including but not limited to partitioning the memory layout according to application-specific code, constant, and data space requirements, the use of FRAM to optimize application energy consumption, and the use of the Memory Protection Unit (MPU) to maximize application robustness by protecting the program code against unintended write accesses, see *MSP430™ FRAM Technology – How To and Best Practices*

6.8 RAM

The RAM is made up of one sector. The sector can be completely powered down in LPM3 and LPM4 to save leakage; however, all data is lost during shutdown.

6.9 Tiny RAM

Twenty-six bytes of Tiny RAM are provided in addition to the complete RAM (see Table 6-36). This memory is always available even in LPM3 and LPM4, while the complete RAM can be powered down in LPM3 and LPM4. Tiny RAM can be used to hold data or a very small stack when the complete RAM is powered down in LPM3 and LPM4. Tiny RAM is not available in LPMx.5.

6.10 Memory Protection Unit (MPU) Including IP Encapsulation

The FRAM can be protected by the MPU from inadvertent CPU execution and read or write access. Features of the MPU include:

- IP encapsulation with programmable boundaries (prevents reads from "outside" like JTAG or non-IP software) in steps of 1KB.
- Main memory partitioning that can be configured in up to three segments in steps of 1KB.
- The access rights for each main and information memory segment can be individually selected.
- Access violation flags with interrupt capability for easy servicing of access violations.

6.11 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. Peripherals can be managed using all instructions. For complete module descriptions, see the *MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide*.

6.11.1 Digital I/O

There are up to nine 8-bit I/O ports implemented:

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Edge-selectable interrupt and LPM3.5 and LPM4.5 wake-up input capability is available for all pins of ports P1 to P4.
- Read and write access to port control registers is supported by all instructions.
- Ports can be accessed byte-wise or word-wise in pairs.
- Capacitive touch functionality is supported on all pins of ports P1 to P7, P9, and PJ.

NOTE

Configuration of Digital I/Os After BOR Reset

To prevent any cross-currents during start-up of the device, all port pins are high-impedance with Schmitt triggers and their module functions disabled. To enable the I/O functionality after a BOR reset, the ports must be configured first and then the LOCKLPM5 bit must be cleared. For details see the "Digital I/O" chapter, section "Configuration After Reset" in the *MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide*.

6.11.2 Oscillator and Clock System (CS)

The clock system includes support for a 32-kHz watch-crystal oscillator XT1 (LF), an internal very-low-power low-frequency oscillator (VLO), an integrated internal digitally controlled oscillator (DCO), and a high-frequency crystal oscillator XT2 (HF). The clock system module is designed to meet the requirements of both low system cost and low power consumption. A fail-safe mechanism exists for all crystal sources. The clock system module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32-kHz watch crystal (LFXT1), the internal low-frequency oscillator (VLO), or a digital external low frequency (<50 kHz) clock source.
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced from a high-frequency crystal (HFXT2), the internal DCO, a 32-kHz watch crystal (LFXT1), the internal VLO, or a digital external clock source.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources made available to MCLK.

6.11.3 Power-Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device . The PMM also includes the supply voltage supervisor (SVS) and brownout protection. The brownout circuit is implemented to provide the proper internal reset signal to the device during power on and power off. The SVS circuitry detects if the supply voltage drops below a safe level. SVS circuitry is available on the primary and core supplies.

6.11.4 Hardware Multiplier

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The module supports signed and unsigned multiplication as well as signed and unsigned multiply-and-accumulate operations.

6.11.5 Real-Time Clock (RTC_C)

The RTC_C module contains an integrated real-time clock (RTC) with the following features implemented:
- Calendar mode with leap year correction
- General-purpose counter mode

The internal calendar compensates for months with fewer than 31 days and includes leap year correction. The RTC_C also supports flexible alarm functions and offset-calibration hardware. RTC operation is available in LPM3.5 modes to minimize power consumption.

6.11.6 Watchdog Timer (WDT_A)

The primary function of the WDT_A module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals. Table 6-8 lists the clocks that the WDT_A module can use.

Table 6-8. WDT_A Clocks

WDTSSEL	NORMAL OPERATION (WATCHDOG AND INTERVAL TIMER MODE)
00	SMCLK
01	ACLK
10	VLOCLK
11	LFMODOSC

6.11.7 System Module (SYS)

The SYS module handles many of the system functions within the device. These system functions include power-on reset and power-up clear handling, NMI source selection and management, reset interrupt vector generators, bootloader entry mechanisms, and configuration management (device descriptors). Also included is a data exchange mechanism using JTAG called a JTAG mailbox that can be used in the application. Table 6-9 lists the SYS module interrupt vector registers.

6.11.8 DMA Controller

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC12_B conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral. Table 6-10 lists the available DMA triggers.

Table 6-10. DMA Trigger Assignments [1]

6.11.9 Enhanced Universal Serial Communication Interface (eUSCI)

The eUSCI modules are used for serial data communication. The eUSCI module supports synchronous communication protocols such as SPI (3 or 4 pin) and I^2C, and asynchronous communication protocols such as UART, enhanced UART with automatic baud-rate detection, and IrDA.

The eUSCI_An module provides support for SPI (3 or 4 pin), UART, enhanced UART, and IrDA.

The eUSCI_Bn module provides support for SPI (3 or 4 pin) and I^2C.

Two eUSCI_A modules and two eUSCI_B modules are implemented.

6.11.10 Timer_A TA0, Timer_A TA1

TA0 and TA1 are 16-bit timers/counters (Timer_A type) with three capture/compare registers each. TA0 and TA1 can support multiple capture/compares, PWM outputs, and interval timing (see Table 6-11 and Table 6-12). TA0 and TA1 have extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.11.11 Timer_A TA2

TA2 is a 16-bit timer/counter (Timer_A type) with two capture/compare registers each and with internal connections only. TA2 can support multiple capture/compares, PWM outputs, and interval timing (see Table 6-13). TA2 has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.11.12 Timer_A TA3

TA3 is a 16-bit timer/counter (Timer_A type) with five capture/compare registers each and with internal connections only. TA3 can support multiple capture/compares, PWM outputs, and interval timing (see Table 6-14). TA3 has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.11.13 Timer_B TB0

TB0 is a 16-bit timer/counter (Timer_B type) with seven capture/compare registers each. TB0 can support multiple capture/compares, PWM outputs, and interval timing (see Table 6-15). TB0 has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.11.14 ADC12_B

The ADC12_B module supports fast 12-bit analog-to-digital conversions with differential and single-ended inputs. The module implements a 12-bit SAR core, sample select control, reference generator and a conversion result buffer. A window comparator with a lower and upper limits allows CPU-independent result monitoring with three window comparator interrupt flags.

Table 6-16 summarizes the available external trigger sources.

Table 6-17 lists the available multiplexing between internal and external analog inputs.

Table 6-16. ADC12_B Trigger Signal Connections

ADC12SHSx		CONNECTED TRIGGER SOURCE

ADC12CH1MAP	A28	N/A[1]
ADC12CH2MAP	A27	N/A[1]
ADC12CH3MAP	A26	N/A[1]

(1) N/A: No internal signal available on this device.

6.11.15 Comparator_E

The primary function of the Comparator_E module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

6.11.16 CRC16

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 signature is based on the CRC-CCITT standard.

6.11.17 CRC32

The CRC32 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC32 signature is based on the ISO 3309 standard.

6.11.18 AES256 Accelerator

The AES accelerator module performs encryption and decryption of 128-bit data with 128-, 192-, or 256-bit keys according to the advanced encryption standard (AES) (FIPS PUB 197) in hardware.

Submit Documentation Feedback

Product Folder Links: *MSP430FR5972 MSP430FR59721 MSP430FR5970 MSP430FR5922 MSP430FR59221*

6.11.19 True Random Seed

The Device Descriptor Info (TLV) (see Section 6.12) contains a 128-bit true random seed that can be used to implement a deterministic random-number generator.

6.11.20 Shared Reference (REF_A)

The REF_A module is responsible for generation of all critical reference voltages that can be used by the various analog peripherals in the device.

6.11.21 Embedded Emulation

6.11.21.1 Embedded Emulation Module (EEM)

The EEM supports real-time in-system debugging. The S version of the EEM has the following features:
- Three hardware triggers or breakpoints on memory access
- One hardware trigger or breakpoint on CPU register write access
- Up to four hardware triggers that can be combined to form complex triggers or breakpoints
- One cycle counter
- Clock control on module level

6.11.21.2 EnergyTrace++ Technology

The devices implement circuitry to support EnergyTrace++ technology. The EnergyTrace++ technology lets you observe information about the internal states of the microcontroller. These states include the CPU Program Counter (PC), the ON or OFF status of the peripherals and the system clocks (regardless of the clock source), and the low-power mode currently in use. These states can always be read by a debug tool, even when the microcontroller sleeps in LPMx.5 modes.

The activity of the following modules can be observed:
- MPY is calculating.
- WDT is counting.
- RTC is counting.
- ADC: a sequence, sample, or conversion is active.
- REF: REFBG or REFGEN active and BG in static mode.
- COMP is on.
- AES is encrypting or decrypting.
- eUSCI_A0 is transferring (receiving or transmitting) data.
- eUSCI_A1 is transferring (receiving or transmitting) data.
- eUSCI_B0 is transferring (receiving or transmitting) data.
- eUSCI_B1 is transferring (receiving or transmitting) data.
- TB0 is counting.
- TA0 is counting.
- TA1 is counting.
- TA2 is counting.
- TA3 is counting.

6.11.22 Input/Output Diagrams

6.11.22.1 Digital I/O Functionality Port P1 to P7 and P9

The port pins provide the following features:

- Interrupt and wakeup from LPMx.5 capability for ports P1 to P4
- Capacitive touch functionality (see Section 6.11.22.2)
- Up to three digital module input and/or output functions

Figure 6-1 shows the features and the corresponding control logic (besides the Capacitive Touch logic). Figure 6-1 is applicable for all port pins P1.0 to P9.7, unless a dedicated diagram is available in the following sections. The module functions provided per pin and whether the direction is controlled by the module or by the port direction register for the selected secondary function are described in the following pin function tables.
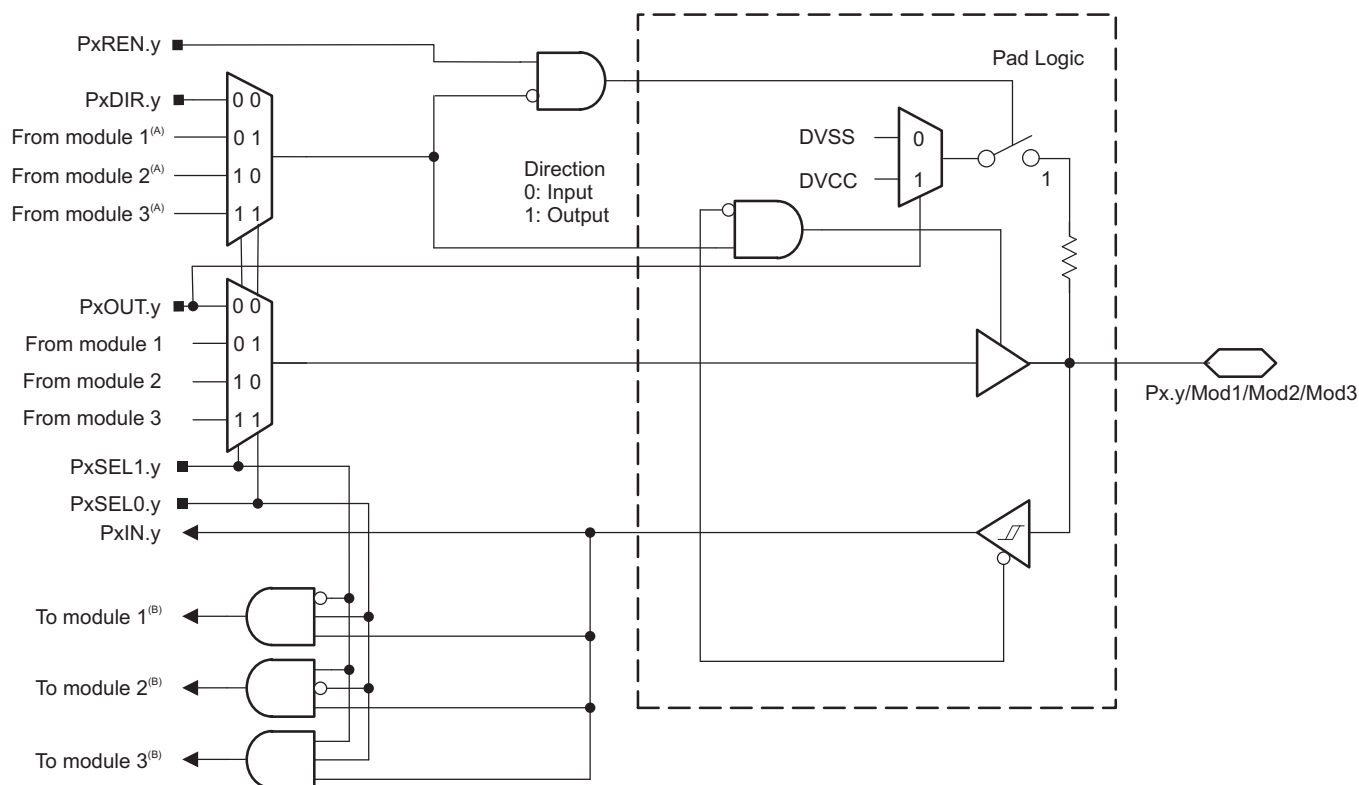

A. The direction is either controlled by connected module or by the corresponding PxDIR.y bit. See pin function tables.

B. The inputs from several pins towards a module are ORed together.

NOTE: Functional representation only.

(1) X = Don't care
(2) Setting P9SEL1.x and P9SEL0.x disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals.
(3) Setting the CEPD.x bit of the comparator disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. Selecting the Cx input pin to the comparator multiplexer with the input select bits in the comparator module automatically disables output driver and input buffer for that pin, regardless of the state of the associated CEPD.x bit.

(1)   X = Don't care
(2)   Setting PJSEL1.4 = 0 and PJSEL0.4 = 1 causes the general-purpose I/O to be disabled. When LFXTBYPASS = 0, PJ.4 and PJ.5 are configured for crystal operation and PJSEL1.5 and PJSEL0.5 are don't cares. When LFXTBYPASS = 1, PJ.4 is configured for bypass operation and PJ.5 is configured as general-purpose I/O.
(3)   When PJ.4 is configured in bypass mode, PJ.5 is configured as general-purpose I/O.
(4)   With PJSEL0.5 = 1 or PJSEL1.5 =1 the general-purpose I/O functionality is disabled. No input function is available. Configured as output, the pin is actively pulled to zero.

		N/A	0	1	0
		CPU Status Register Bit CPUOFF	1		
		N/A	0	1	1
		Internally tied to DVSS	1		

(1) X = Don't care
(2) Default condition
(3) The pin direction is controlled by the JTAG module. JTAG mode selection is made by the SYS module or by the Spy-Bi-Wire 4-wire entry sequence. Neither PJSEL1.x and PJSEL0.x nor CEPD.x bits have an effect in these cases.
(4) Do not use this pin as SMCLK output if the TB0OUTH functionality is used on any other pin. Select an alternative SMCLK output pin.
(5) In JTAG mode, pullups are activated automatically on TMS, TCK, and TDI/TCLK. PJREN.x are don't care.

(2) ADC gain: The gain correction factor is measured using the internal voltage reference with REFOUT = 0. Other settings (for example, with REFOUT = 1) can result in different correction factors.
(3) ADC offset: The offset correction factor is measured using the internal 2.5-V reference.

6.14 Identification

6.14.1 Revision Identification

The device revision information is shown as part of the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to the errata sheets for the devices in this data sheet, see Section 8.4.

The hardware revision is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the "Hardware Revision" entries in Section 6.12.

6.14.2 Device Identification

The device type can be identified from the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to the errata sheets for the devices in this data sheet, see Section 8.4.

A device identification value is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the "Device ID" entries in Section 6.12.

6.14.3 JTAG Identification

Programming through the JTAG interface, including reading and identifying the JTAG ID, is described in detail in *MSP430 Programming With the JTAG Interface*.

7 Applications, Implementation, and Layout

> **NOTE**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 Device Connection and Layout Fundamentals

This section describes the recommended guidelines when designing with the MSP430. These guidelines are to make sure that the device has proper connections for powering, programming, debugging, and optimum analog performance.

7.1.1 Power Supply Decoupling and Bulk Capacitors

TI recommends connecting a combination of a 1-µF plus a 100-nF low-ESR ceramic decoupling capacitor to each AVCC and DVCC pin. Higher-value capacitors may be used but can impact supply rail ramp-up time. Decoupling capacitors must be placed as close as possible to the pins that they decouple (within a few millimeters). Additionally, TI recommends separated grounds with a single-point connection for better noise isolation from digital to analog circuits on the board and to achieve high analog accuracy.
Figure 7-1. Power Supply Decoupling

7.1.2 External Oscillator

Depending on the device variant (see Section 3), the device can support a low-frequency crystal (32 kHz) on the LFXT pins, a high-frequency crystal on the HFXT pins, or both. External bypass capacitors for the crystal oscillator pins are required.

It is also possible to apply digital clock signals to the LFXIN and HFXIN input pins that meet the specifications of the respective oscillator if the appropriate LFXTBYPASS or HFXTBYPASS mode is selected. In this case, the associated LFXOUT and HFXOUT pins can be used for other purposes. If they are left unused, they must be terminated according to Section 4.6.

Figure 7-2 shows a typical connection diagram.

Figure 7-2. Typical Crystal Connection

See *MSP430 32-kHz Crystal Oscillators* for more information on selecting, testing, and designing a crystal oscillator with the MSP430 devices.

7.1.3 JTAG

With the proper connections, the debugger and a hardware JTAG interface (such as the MSP-FET or MSP-FET430UIF) can be used to program and debug code on the target board. In addition, the connections also support the MSP-GANG production programmers, thus providing an easy way to program prototype boards, if desired. Figure 7-3 shows the connections between the 14-pin JTAG connector and the target device required to support in-system programming and debugging for 4-wire JTAG communication. Figure 7-4 shows the connections for 2-wire JTAG mode (Spy-Bi-Wire).

The connections for the MSP-FET and MSP-FET430UIF interface modules and the MSP-GANG are identical. Both can supply V_{CC} to the target board (through pin 2). In addition, the MSP-FET and MSP-FET430UIF interface modules and MSP-GANG have a V_{CC}-sense feature that, if used, requires an alternate connection (pin 4 instead of pin 2). The V_{CC}-sense feature senses the local V_{CC} present on the target board (that is, a battery or other local power supply) and adjusts the output signals accordingly. Figure 7-3 and Figure 7-4 show a jumper block that supports both scenarios of supplying V_{CC} to the target board. If this flexibility is not required, the desired V_{CC} connections may be hard-wired to eliminate the jumper block. Pins 2 and 4 must not be connected at the same time.

For additional design information regarding the JTAG interface, see the *MSP430 Hardware Tools User's Guide*.

SLASE66C –APRIL 2015–REVISED AUGUST 2018

www.ti.com
A. Make connection J1 if a local target power supply is used, or make connection J2 if the target is powered from the debug or programming adapter.

B. The device $\overline{RST}$/NMI/SBWTDIO pin is used in 2-wire mode for bidirectional communication with the device during JTAG access, and any capacitance that is attached to this signal may affect the ability to establish a connection with the device. The upper limit for C1 is 2.2 nF when using current TI tools.

Figure 7-4. Signal Connections for 2-Wire JTAG Communication (Spy-Bi-Wire)

7.1.4 Reset

The reset pin can be configured as a reset function (default) or as an NMI function in the special function register (SFR) SFRRPCR.

In reset mode, the $\overline{RST}$/NMI pin is active low, and a pulse applied to this pin that meets the reset timing specifications generates a BOR-type device reset.

Setting SYSNMI causes the $\overline{RST}$/NMI pin to be configured as an external NMI source. The external NMI is edge sensitive, and its edge is selectable by SYSNMIIES. Setting the NMIIE enables the interrupt of the external NMI. When an external NMI event occurs, the NMIIFG is set.

The $\overline{RST}$/NMI pin can have either a pullup or pulldown that is enabled or not. SYSRSTUP selects either pullup or pulldown, and SYSRSTRE causes the pullup (default) or pulldown to be enabled (default) or not. If the $\overline{RST}$/NMI pin is unused, it is required either to select and enable the internal pullup or to connect an external 47-kΩ pullup resistor to the $\overline{RST}$/NMI pin with a 10-nF pulldown capacitor. The pulldown capacitor should not exceed 2.2 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools like FET interfaces or GANG programmers.

See the *MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide* for more information on the referenced control registers and bits.

7.1.5 Unused Pins

For details on the connection of unused pins, see Section 4.6.

www.ti.com   SLASE66C –APRIL 2015–REVISED AUGUST 2018

7.1.6 General Layout Recommendations

- Proper grounding and short traces for external crystal to reduce parasitic capacitance. See *MSP430 32-kHz Crystal Oscillators* for recommended layout guidelines.
- Proper bypass capacitors on DVCC, AVCC, and reference pins if used.
- Avoid routing any high-frequency signal close to an analog signal line. For example, keep digital switching signals such as PWM or JTAG signals away from the oscillator circuit.
- Proper ESD level protection should be considered to protect the device from unintended high-voltage electrostatic discharge. See *MSP430 System-Level ESD Considerations* for guidelines.

7.1.7 Do's and Don'ts

TI recommends powering AVCC and DVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference between AVCC and DVCC must not exceed the limits specified in Section 5.1. Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and FRAM.

7.2 Peripheral- and Interface-Specific Design Information

7.2.1 ADC12_B Peripheral

7.2.1.1 Partial Schematic

Figure 7-5 shows the recommended decoupling circuit when an external voltage reference is used. The internal reference module has a maximum drive current as specified in the $I_{O(VREF+)}$ specification of the REF module.
Figure 7-5. ADC12_B Grounding and Noise Considerations

7.2.1.2 Design Requirements

As with any high-resolution ADC, appropriate printed-circuit-board layout and grounding techniques should be followed to eliminate ground loops, unwanted parasitic effects, and noise.

Ground loops are formed when return current from the ADC flows through paths that are common with other analog or digital circuitry. If care is not taken, this current can generate small unwanted offset voltages that can add to or subtract from the reference or input voltages of the ADC. The general guidelines in Section 7.1.1 combined with the connections shown in Section 7.2.1.1 prevent this.

In addition to grounding, ripple and noise spikes on the power-supply lines that are caused by digital switching or switching power supplies can corrupt the conversion result. TI recommends a noise-free design using separate analog and digital ground planes with a single-point connection to achieve high accuracy.

MSP430FR5972, MSP430FR59721, MSP430FR5970, MSP430FR5922, MSP430FR59221
MSP430FR5872, MSP430FR58721, MSP430FR5870

SLASE66C – APRIL 2015 – REVISED AUGUST 2018

www.ti.com

The reference voltage must be a stable voltage for accurate measurements. The capacitor values that are selected in the general guidelines filter out the high- and low-frequency ripple before the reference voltage enters the device. In this case, the 10-µF capacitor is used to buffer the reference pin and filter any low-frequency ripple. A 470-nF bypass capacitor is used to filter out any high-frequency noise.

7.2.1.3 Detailed Design Procedure

For additional design information, see *Designing With the MSP430FR58xx, FR59xx, FR68xx, and FR69xx ADC*.

7.2.1.4 Layout Guidelines

Components that are shown in the partial schematic (see Figure 7-5) should be placed as close as possible to the respective device pins. Avoid long traces, because they add additional parasitic capacitance, inductance, and resistance on the signal.

Avoid routing analog input signals close to a high-frequency pin (for example, a high-frequency PWM), because the high-frequency switching can be coupled into the analog signal.

If differential mode is used for the ADC12_B, the analog differential input signals must be routed close together to minimize the effect of noise on the resulting signal.

8 Device and Documentation Support

8.1 Getting Started and Next Steps

For more information on the MSP430™ family of devices and the tools and libraries that are available to help with your development, visit the Getting Started page.

8.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. Figure 8-1 provides a legend for reading the complete device name.

Processor Family	MSP = Mixed Signal Processor XMS = Experimental Silicon			
MCU Platform	430 = TI's 16-bit MSP430 Low-Power Microcontroller Platform

8.3 Tools and Software

All MSP microcontrollers are supported by a wide variety of software and hardware development tools. Tools are available from TI and various third parties. See them all at Development Kits and Software for Low-Power MCUs.

Table 8-1 lists the debug features of the MSP430FR597x(1), MSP430FR592x(1) and MSP430FR587x(1) MCUs. See the *Code Composer Studio for MSP430 User's Guide* for details on the available features.

Table 8-1. Hardware Debug Features

MSP430 ARCHITECTURE	4-WIRE JTAG	2-WIRE JTAG	BREAK-POINTS	RANGE BREAK-POINTS	CLOCK CONTROL	STATE SEQUENCER	TRACE BUFFER	LPMx.5 DEBUGGING SUPPORT	EnergyTrace++ TECHNOLOGY
MSP430Xv2	Yes	Yes	3	Yes	Yes	No	No	Yes	Yes

Design Kits and Evaluation Modules

MSP430FR6989 LaunchPad Development Kit The MSP-EXP430FR6989 LaunchPad Development Kit is an easy-to-use Evaluation Module (EVM) for the MSP40FR6989 microcontroller (MCU). It contains everything needed to start developing on the ultra-low-power MSP430FRx FRAM microcontroller platform, including onboard emulation for programming, debugging, and energy measurements.

MSP-TS430PM64F - MSP430 64-pin FRAM Target Socket Board The MSP-TS430PZ5X100 is a stand-alone ZIF socket target board used to program and debug the MSP430 MCU in-system through the JTAG interface or the Spy-Bi-Wire (2-wire JTAG) protocol.

MSP-FET430U64F - MSP430 64-pin FRAM TS Board and MSP-FET Bundle The MSP-FET430U64F is a bundle containing the MSP-FET emulator and a stand-alone 64-pin ZIF socket target board to program and debug the MSP430 in-system through the JTAG interface or the Spy-Bi-Wire (2-wire JTAG) protocol. The TS development board supports the MSP430FR6972 FRAM device in a 64-pin LQFP package (TI package code: PM).

Software

MSP430Ware™ Software MSP430Ware software is a collection of code examples, data sheets, and other design resources for all MSP430 devices delivered in a convenient package. In addition to providing a complete collection of existing MSP430 MCU design resources, MSP430Ware software also includes a high-level API called MSP Driver Library. This library makes it easy to program MSP430 hardware. MSP430Ware software is available as a component of CCS or as a stand-alone package.

MSP430FR592x, MSP430FR5x7x, MSP430FR6x2x, MSP430FR6x7x Code Examples C Code examples are available for every MSP device that configures each of the integrated peripherals for various application needs.

Capacitive Touch Software Library Free C libraries for enabling capacitive touch capabilities on MSP430 MCUs. The MSP430 MCU version of the library features several capacitive touch implementations including the RO and RC method.

MSP Driver Library The abstracted API of MSP Driver Library provides easy-to-use function calls that free you from directly manipulating the bits and bytes of the MSP430 hardware. Thorough documentation is delivered through a helpful API Guide, which includes details on each function call and the recognized parameters. Developers can use Driver Library functions to write complete projects with minimal overhead.

MSP EnergyTrace™ Technology EnergyTrace technology for MSP430 microcontrollers is an energy-based code analysis tool that measures and displays the energy profile of the application and helps to optimize it for ultra-low-power consumption.

ULP (Ultra-Low Power) Advisor ULP Advisor™ software is a tool for guiding developers to write more efficient code to fully use the unique ultra-low-power features of MSP and MSP432 microcontrollers. Aimed at both experienced and new microcontroller developers, ULP Advisor checks your code against a thorough ULP checklist to help minimize the energy consumption of your application. At build time, ULP Advisor provides notifications and remarks to identify areas of your code that can be further optimized for lower power.

SLASE66C –APRIL 2015–REVISED AUGUST 2018

IEC60730 Software Package The IEC60730 MSP430 software package was developed to help customers comply with IEC 60730-1:2010 (Automatic Electrical Controls for Household and Similar Use – Part 1: General Requirements) for up to Class B products, which includes home appliances, arc detectors, power converters, power tools, e-bikes, and many others. The IEC60730 MSP430 software package can be embedded in customer applications running on MSP430s to help simplify the customer's certification efforts of functional safety-compliant consumer devices to IEC 60730-1:2010 Class B.

Fixed Point Math Library for MSP The MSP IQmath and Qmath Libraries are a collection of highly optimized and high-precision mathematical functions for C programmers to seamlessly port a floating-point algorithm into fixed-point code on MSP430 and MSP432 devices. These routines are typically used in computationally intensive real-time applications where optimal execution speed, high accuracy, and ultra-low energy are critical. By using the IQmath and Qmath libraries, it is possible to achieve execution speeds considerably faster and energy consumption considerably lower than equivalent code written using floating-point math.

Floating Point Math Library for MSP430 Continuing to innovate in the low-power and low-cost microcontroller space, TI provides MSPMATHLIB. Leveraging the intelligent peripherals of MSP devices, this floating-point math library of scalar functions is up to 26 times faster than the standard MSP430 math functions. Mathlib is easy to integrate into your designs. This library is free and is integrated in both Code Composer Studio IDE and IAR Embedded Workbench IDE.

Development Tools

Code Composer Studio™ Integrated Development Environment for MSP Microcontrollers Code Composer Studio (CCS) integrated development environment (IDE) supports all MSP microcontroller devices. CCS comprises a suite of embedded software utilities used to develop and debug embedded applications. CCS includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features.

Command-Line Programmer MSP Flasher is an open-source shell-based interface for programming MSP microcontrollers through a FET programmer or eZ430 using JTAG or Spy-Bi-Wire (SBW) communication. MSP Flasher can download binary files (.txt or .hex) directly to the MSP microcontroller without an IDE.

MSP MCU Programmer and Debugger The MSP-FET is a powerful emulation development tool – often called a debug probe – which lets users quickly begin application development on MSP low-power MCUs. Creating MCU software usually requires downloading the resulting binary program to the MSP device for validation and debugging.

MSP-GANG Production Programmer The MSP Gang Programmer is an MSP430 or MSP432 device programmer that can program up to eight identical MSP430 or MSP432 flash or FRAM devices at the same time. The MSP Gang Programmer connects to a host PC using a standard RS-232 or USB connection and provides flexible programming options that let the user fully customize the process.

8.4 Documentation Support

The following documents describe the MSP430FR597x(1), MSP430FR592x(1) and MSP430FR587x(1) MCUs. Copies of these documents are available on the Internet at www.ti.com.

Receiving Notification of Document Updates

To receive notification of documentation updates—including silicon errata—go to the product folder for your device on ti.com (for links to product folders, see Section 8.5). In the upper right corner, click the "Alert me" button. This registers you to receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

Errata

MSP430FR5972 Device Erratasheet Describes the known exceptions to the functional specifications.

MSP430FR59721 Device Erratasheet Describes the known exceptions to the functional specifications.

MSP430FR5922 Device Erratasheet Describes the known exceptions to the functional specifications.

MSP430FR58721 Device Erratasheet Describes the known exceptions to the functional specifications.

MSP430FR5870 Device Erratasheet Describes the known exceptions to the functional specifications.

User's Guides

MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide Detailed information on the modules and peripherals available in this device family.

MSP430 FRAM Device Bootloader (BSL) User's Guide The bootloader (BSL) on MSP430 MCUs lets users communicate with embedded memory in the MSP430 MCU during the prototyping phase, final production, and in service. Both the programmable memory (FRAM memory) and the data memory (RAM) can be modified as required.

MSP430 Programming With the JTAG Interface This document describes the functions that are required to erase, program, and verify the memory module of the MSP430 flash-based and FRAM-based microcontroller families using the JTAG communication port. In addition, it describes how to program the JTAG access security fuse that is available on all MSP430 devices. This document describes device access using both the standard 4-wire JTAG interface and the 2-wire JTAG interface, which is also referred to as Spy-Bi-Wire (SBW).

MSP430 Hardware Tools User's Guide This manual describes the hardware of the TI MSP-FET430 Flash Emulation Tool (FET). The FET is the program development tool for the MSP430 ultra-low-power microcontroller. Both available interface types, the parallel port interface and the USB interface, are described.

Application Reports

Getting Started With EEMBC ULPBench on MSP-EXP430FR5969 This is a getting started guide for obtaining the ULPMark™-CP score using the Embedded Microprocessor Benchmark Consortium (EEMBC) ULPBench™ and EnergyMonitor with the MSP430FR5969 microcontroller (MCU). This document uses the MSP-EXP430FR5969 LaunchPad development kit as the target evaluation module (EVM) for performing the benchmark. ULPBench is a EEMBC benchmark providing an industry-standard method to measure ultra-low-power capabilities of MCUs.

www.ti.com   SLASE66C – APRIL 2015 – REVISED AUGUST 2018

MSP430 FRAM Technology – How-To and Best Practices FRAM is a nonvolatile memory technology that behaves like SRAM while enabling a whole host of new applications, but also changes the way firmware should be designed. This application report outlines the how-to and best practices of using FRAM technology in MSP430 from an embedded software development perspective. It discusses how to implement a memory layout according to application-specific code, constant, data space requirements, the use of FRAM to optimize application energy consumption, and the use of the Memory Protection Unit (MPU) to maximize application robustness by protecting the program code against unintended write accesses.

MSP430 32-kHz Crystal Oscillators Selection of the correct crystal, correct load circuit, and proper board layout are important for a stable crystal oscillator. This application report summarizes crystal oscillator function and explains the parameters to select the correct crystal for MSP430 ultra-low-power operation. In addition, hints and examples for correct board layout are given. The document also contains detailed information on the possible oscillator tests to ensure stable oscillator operation in mass production.

MSP430 System-Level ESD Considerations System-Level ESD has become increasingly demanding with silicon technology scaling towards lower voltages and the need for designing cost-effective and ultra-low-power components. This application report addresses three different ESD topics to help board designers and OEMs understand and design robust system-level designs.

8.7 Trademarks

EnergyTrace++, MSP430, MSP430Ware, EnergyTrace, ULP Advisor, Code Composer Studio, E2E are trademarks of Texas Instruments.
ULPMark, ULPBench are trademarks of Embedded Microprocessor Benchmark Consortium.
Microsoft is a registered trademark of Microsoft Corporation.
All other trademarks are the property of their respective owners.

8.8 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.9 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

8.10 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MO-153.

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate
   design recommendations.
8. Board assembly site may have different recommendations for stencil design.

NOTES: A.   All linear dimensions are in millimeters.
          B.   This drawing is subject to change without notice.
          C.   Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should
               contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric
               metal load solder paste. Refer to IPC−7525 for other stencil recommendations.
          D.   Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature
   number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown
   on this view. It is recommended that vias under paste be filled, plugged or tented.
